AMG	Italiano	Deutsch	Nederlands	Français
1.1	Acciaio dolce magnetico	Magnetweicheisen	Automatenstaal, zachtstaal	Acier doux magnétique
1.2	Acciaio da costruzione e da cementazione	Baustahl, Einsatzstahl	Constructiestaal, inzetstaal	Acier de construction, Acier de cémentation
1.3	Acciaio al carbonio	Kohlenstoffstahl	Koolstofstaal	Acier au carbone ordinaire
1.4	Acciaio legato	Legierter Stahl	Gelegeerd staal	Acier allié
1.5	Acciaio legato / Acciaio bonificato e temprato	Legierter und vergüteter Stahl	Gelegeerd en veredeld staal	Acier allié/ Acier trempé et revenu
1.6	Acciaio legato / Acciaio bonificato e temprato	Legierter und vergüteter Stahl	Hooggelegeerd veredeld staal	Acier allié/ Acier trempé et revenu
1.7	Acciaio legato/temprato	Legierter gehärteter Stahl	Gelegeerd en gehard staal	Acier allié trempé
1.8	Acciaio legato/temprato	Legierter gehärteter Stahl	Gelegeerd en gehard staal	Acier allié trempé
2.1	Acciaio inossidabile/automatico	Rostfreier Stahl, geschwefelt	Roestvast automatenstaal	Acier inoxydable de décolletage
2.2	Austenitico	Austenitisch	Austenitisch	Austénitique
2.3	Ferritico+Austenitico, Martensitico	Ferritisch+Austenitisch, Martensitisch	Ferritisch+Austenitisch, Martensitisch	Ferritique + Austénitique, Martensitique
2.4	Acciai inossidabili con indurimento da precipitazione	Vergüteter rostfreier Stahl	Precipitatiehardend roestvast staal	Acier inoxydable Trempé
3.1	Ghisa con grafite lamellare	Grauguss	Gietijzer Lamellair	Graphite lamellaire
3.2	Ghisa con grafite lamellare	Vergüteter Grauguss	Gietijzer Lamellair	Graphite lamellaire
3.3	Ghisa malleabile con grafite sferoidale	Kugelgraphitguss, Temperguss	Nodulair gietijzer / Smeedbaar gietijzer	Graphite nodulaire/ Fonte malléable
3.4	Ghisa malleabile con grafite sferoidale	Kugelgraphitguss, Temperguss	Nodulair gietijzer / Smeedbaar gietijzer	Graphite nodulaire/ Fonte malléable
4.1	Titanio non legato	Reintitan	Titaan, ongelegeerd	Titane, non-allié
4.2	Leghe di titanio	Titan-Legierungen	Titaan, gelegeerd	Titane, allié
4.3	Leghe di titanio	Titan-Legierungen	Titaan, gelegeerd	Titane, allié
5.1	Nichel non legato	Reinnickel	Nikkel, ongelegeerd	Nickel, non-allié
5.2	Leghe di nichel	Nickel-Legierungen	Nikkel, gelegeerd	Nickel, allié
5.3	Leghe di nichel	Nickel-Legierungen	Nikkel, gelegeerd	Nickel, allié
6.1	6.1 Rame	Kupfer	Koper	Cuivre
6.2	β-Ottone, Bronzo	Kurzspanendes Messing, Bronze	β-Messing, brons	β-Laiton, Bronze
6.3	α-Ottone	Langspanendes Messing	α-Messing	α-Laiton
6.4	Bronzo ad alta resistenza	Cu-Al-Fe-Legierung, (Ampco)	Extra-sterk brons	Bronze, haute résistance
7.1	Al, Mg, non legato	Al, Mg, unlegiert	Al, Mg, ongelegeerd	Al, Mg, non-allié
7.2	Leghe di Al, Si < 0.5%	Al legiert, Si<0.5%	Al gelegeerd, Si < 0.5%	Al allié, Si < 0.5%
7.3	Leghe di Al, Si > 0.5% < 10%	Al legiert, Si>0.5%<10%	Al gelegeerd, Si > 0.5% < 10%	Al allié, Si > 0.5% < 10%
7.4	Leghe di Al, Si > 10% Rinforzate Whisker Leghe di Al, Leghe di Mg	Al legiert, Si>10% Whisker verstärkte Al-Legierung, Mg-Legierung	Al gelegeerd, Si>10% whisker versterkt Al-legeringen, Mg-legeringen	Al allié, Si>10% Alliages d'Al ou Mg, céramique renforcée
8.1	Materiali termoplastici	Thermoplaste	Thermoplasten	Thermoplastiques
8.2	Materiali plastici termoindurenti	Duroplaste	Duraplasten	Plastiques thermodurcissables
8.3	Materiali plastici rinforzati	Faserverstärkte Kunststoffe	Versterkte kunststofmaterialen	Plastiques renforcés
9.1	Cermets (materiali metallo-ceramici)	Cermets (Metallkeramik)	Cermets (metal-ceramics)	Cermets (céramiques metalliques)
10.1	Grafite standard	Graphit	Standaard Grafiet	Graphite standard

FORATURA

Informazioni Generali sulla Foratura

1. Selezionate la punta più idonea per l'applicazione, per il tipo di materiale da lavorare, le caratteristiche della macchina utensile ed il lubrorefrigerante da usare.

2. Troppo gioco tra il pezzo da lavorare ed il mandrino della macchina possono rovinare l'utensile, il pezzo stesso e la macchina – assicuratevi sempre che vi sia la massima stabilità, che, comunque, può essere migliorata selezionando la punta più corta in relazione al lavoro da eseguire.

3. La tenuta dell'utensile è un aspetto importante nelle operazioni di foratura e la punta non deve né ruotare né muoversi nel portautensili.

4. L'uso corretto di un codolo cono Morse dipende dal perfetto accoppiamento tra le superfici coniche dell'utensile ed il portautensili. E' consigliabile l'uso di un martello di materiale tenero per inserire la punta nel portautensili.

5. E' consigliabile l'uso di lubrorefrigeranti o lubrificanti in operazioni di foratura. Assicurarsi di un'emissione copiosa di lubrificante o lubrorefrigerante in particolare sul punto di foratura.

6. La rimozione del truciolo in fase di foratura è essenziale per garantire una lavorazione corretta. Non lasciare che i trucioli intasino le scanalature.

7. In fase di riaffilatura della punta, far sempre in modo che la geometria originale sia ripristinata e che tutti i segni di usura vengano eliminati.

TIPI DI PUNTE

Con il continuo progredire delle configurazioni geometriche, dei materiali di fabbricazione e dei rivestimenti aumenta la capacità di una punta di forare con diversi valori di tolleranza sul diametro. In generale, un utensile a geometria standard da origine ad un foro con tolleranza H12.Con l'aumento della complessità geometrica della punta il foro potrà raggiungere, in condizioni favorevoli, anche tolleranza H8.

- Punte in acciaio super-rapido per impieghi generali – H12
- Punte per foratura profonda in acciaio super-rapido /HSS-E a scanalatura parabolica (PFX) – H10
- Punte in metallo duro per alte prestazioni rivestite al TiN / TiALN (CDX) – H8/H9

FORATURA PROFONDA

Per operazioni di foratura profonda si possono usare vari metodi per ottenere la profondità richiesta. L'esempio sotto riportato mostra quattro diversi modi di forare con profondità di 10 x il diametro della punta.

	Foratura in Serie	Foratura in Serie
Nr/ Di punte	3 (2,5xD, 6xD,10xD)	2 (2,5xD,10xD)
Tipo di punta	Geometria standard, impieghi generali	2.5xD ADX or PFX 10xD PFX
+ / -	Costoso Lungo	Più efficace, veloce

	Foratura ad utensile unico - con più estrazioni	Foratura ad utensile unico - senza estrazioni
Nr/ Di punte	1 (10xD)	1 (10xD)
Tipo di punta	Geometria standard, impieghi generali	Geometria PFX ed utensili per impieghi specifici
+ / -	Lungo	Efficace Veloce

RISOLUZIONE PROBLEMI DURANTE LA FORATURA

PROBLEMA	CAUSA	SOLUZIONE
Tenoni rotti o deformati	Cattiva tenuta tra codolo e portautensile	Verificare che codlo e portautensile siano puliti e esenti da danni.
Fessurazione del nucleo	Avanzamento troppo elevato	Ridurre avanzamento a valori ottimali
	Insufficiente spoglia iniziale	Riaffilare secondo specifiche
	Eccessivo assottigliamento del nucleo	Riaffilare secondo specifiche
	Grave urto al vertice dell'utensile	Evitare il fenomeno. Fare attenzione in fase di inserimento/estrazione nel/dal mandrino di punte a codolo conico
Spigoli di taglio consumati	Velocità eccessiva	Ridurre la velocità a valori ottimali - si potrebbe aumentare l'avanzamento
Spigoli di taglio esterni danneggiati	Cattivo assemblaggio	Ridurre il gioco fra i componenti
Spoglie scheggiate	Eccessivo gioco iniziale	Riaffilare secondo specifica
Rottura ad inizio scanalatura	Intasamento delle scanalature	Adottare concetto di foratura con scarichi intermedi
	Slittamento utensile nel mandrino	Assicurarsi che l'utensile sia fissato correttamente nel mandrino porta-punta
Traccia "a spirale" nel foro	Avanzamento insufficiente	Aumentare avanzamento
	Scarsa precisione nel posizionamento	Usare una punta da centro prima della foratura
Diametro foro eccessivamente largo	Geometria non corretta dell'utensile	Verificare la geometria di riaffilatura
	Rimozione truciolo insufficiente	Modificare velocità, avanzamento e numero di scarichi per consentire una migliore evacuazione del truciolo.

INFORMAZIONI GENERALI SULL' ALESATURA

Per ottenere i migliori risultati nell'utilizzo degli alesatori è necessario farli "lavorare".
E' un errore comune preparare i fori per l'alesatura con sovrametallo troppo scarso. Se il sovrametallo è insufficiente l'alesatore tenderà a comprimere il materiale piuttosto che tagliarlo, usurandosi velocemente con conseguente perdita di diametro. E' altrettanto importante non lasciare troppo sovrametallo nel foro di preparazione
(Vedere Rimozione del Sovrametallo sotto riportata).

1. Selezionare l'alesatore, la velocità e l'avanzamento più consoni per l'operazione. Assicurarsi che i prefori abbiano il diametro corretto.

2. Il pezzo deve essere mantenuto rigido ed il mandrino non avere gioco.

3. Il mandrino che regge l'alesatore a codolo cilindrico deve essere di buona qualità. Se l'alesatore ruotasse nel mandrino e l'avanzamento fosse automatico, l'alesatore potrebbe arrivare a rottura.

4. Mantenere al minimo la lunghezza libera dell'utensile fuori dal mandrino della macchina.

5. Usare esclusivamente lubrificanti raccomandati per salvaguardare la vita dell'utensile e verificare che il fluido giunga nelle zone di taglio in modo corretto. Poichè l'alesatura non è un'operazione gravosa, l'impiego di una emulsione diluita 40: 1 è sufficiente. Per ghisa grigia, in operazioni a secco, si può impiegare anche un getto d'aria.

6. Le scanalature dell'alesatore non dovranno mai intasarsi di trucioli.

7. Prima della riaffilatura dell'alesatore verificare il valore di concentricità disponendo l'utensile fra i centri. In molti casi sarà sufficiente riaffilare solo lo smusso imbocco.

8. Gli alesatori devono essere sempre affilati. Una frequente riaffilatura è utile, ma è importante comprendere che gli alesatori tagliano solo sullo smusso e non sui taglienti cilindrici. Di conseguenza solo tali smussi richiedono la raffilatura. L'accuratezza nell'operazione è indispensabile per salvaguardare la qualità dei fori e la vita dell'utensile.

RIMOZIONE DEL SOVRAMETALLO

Nelle operazioni di alesatura la quantità di sovrametallo da rimuovere dipende dal tipo di materiale e di finitura superficiale del pre-foro. Una guida per la rimozione del sovrametallo viene indicata nelle tabelle sotto riportate:

Misura del foro alesato (mm)	Con pre-foro	Con allargatore
Sotto 4	0.1	0.1
Da 4 a 11	0.2	0.15
Da 39 a 50	0.3	0.2
Da 39 a 50	0.4	0.3

Misura del foro alesato (pollici)	Con preforo	Con allargatore
Sotto 3/16	0.004	0.004
Da 3/16 a 1⁄2	0.008	0.006
Da 1⁄2 a 1. 1⁄2	0.010	0.008
Da 1.1⁄2 a 2	0.016	0.010

LIMITI DI TOLLERANZA

1. DIAMETRO DI TAGLIO DI ALESATORI STANDARD
   Il diametro (d1) è misurato sul diametro immediatamente prossimo allo smusso. la tolleranza è secondo DIN 1420 e dà origine a fori H7.

TOLLERANZA ALESATORE			
Diametro (mm)		Limite di tolleranza (mm)	
Oltre	Fino a incluso	Alta +	Bassa +
	3	0.008	0.004
3	6	0.010	0.005
6	10	0.012	0.006
10	18	0.015	0.008

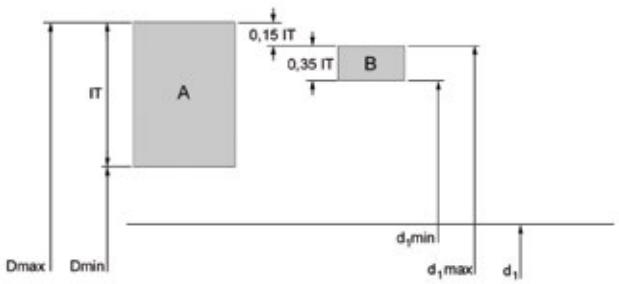
TOLLERANZA ALESATORE			
Diametro (mm)		Limite di tolleranza (mm)	
Oltre	Fino a incluso	Alta +	Bassa +
18	30	0.017	0.009
30	50	0.021	0.012
50	80	0.025	0.014

2. FORO H7
   La tolleranza più comune su un foro H7 (vedi tabella sotto). Per qualsiasi altra tolleranza usare il punto 3 per il calcolo del campo di tolleranza e la dimensione dell'alesatore.

TOLLERANZA FORO			
Diametro (mm)		Limite di tolleranza (mm)	
Oltre	Fino a incluso	Alta +	Bassa +
	3	0.010	0
3	6	0.012	0
6	10	0.015	0
10	18	0.018	0

TOLLERANZA FORO			
Diametro (mm)		Limite di tolleranza (mm)	
Oltre	Fino a incluso	Alta +	Bassa +
18	30	0.021	0
30	50	0.025	0
50	80	0.030	0

3. Quando necessario, definire le dimensioni di un alesatore speciale per operazioni di taglio secondo tolleranze specifiche, come ad esempio D8, si consiglia la consultazione di questo manuale.



A = Tolleranza foro
B = Tolleranza alesatore
IT = Campo di tolleranza
Dmax = Diametro max del foro
Dmin = Diametro min del foro
d_1 = Diametro nominale
$d_1$max = Diametro max alesatore
$d_1$min = Diametro min alesatore

	Campo di tolleranza (µmm) in relazione al diametro (mm)							
Campo di tolleranza	da 1 fino a 3	da 3 fino a 6	da 6 fino a 10	da 10 fino a 18	da 18 fino a 30	da 30 fino a 50	da 50 fino a 80	da 80 fino a 120
IT5	4	5	6	8	9	11	13	15
IT6	6	8	9	11	13	16	19	22
IT7	10	12	15	18	21	25	30	35
IT8	14	18	22	27	33	39	46	54
IT9	25	30	36	43	52	62	74	87
IT10	40	48	58	70	84	100	120	140
IT11	60	75	90	110	130	160	190	220
IT12	100	120	150	180	210	250	300	350

Esempio di foro da 10mm con tolleranza D8, Diametro Massimo del Foro = 10.062, Diametro Minimo del Foro = 10.040
Il limite massimo per l'alesatore è il limite massimo della grandezza del foro ridotta di 0.15 volte la tolleranza del foro. Il valore è, poi, arrotondato al multiplo superiore di 0.001mm
0.15 x tolleranza foro (IT8) = 0.0033, arrotondato = 0.004
Il limite minimo per l'alesatore è il limite massimo dell'alesatore stesso ridotto di 0.35 volte la tolleranza del foro. Il valore è, poi, arrotondato al multiplo superiore di 0.001mm.
0.35 x tolleranza foro (IT8) = 0.0077, arrotondato = 0.008
Limite massimo per l'alesatore = 10.062 - 0.004 = 10.058
Limite minimo per l'alesatore = 10.058 - 0.008 = 10.050

RISOLUZIONE DEI PROBLEMI DURANTE L'ALESATURA

PROBLEMA	CAUSA	SOLUZIONE
tenoni rotti o deformati	Tenuta insufficiente tra codolo e bussola di presa	Verificare che codolo e bussola siano puliti ed esenti da danni
Rapida usura utensile	Insufficiente sovrametallo da rimuovere	Aumentare il quantitativo di sovrametallo da asportare
Foro sovradimensionato	Eccessiva variazione in altezza del tagliente	Riaffilare a specifica
	Il mandrino della macchina è instabile	Eseguire Rettifica mandrino
	Difetti del portautensile	Sostituire il portautensile
	Codolo dell'utensile danneggiato	Sostituire o riaffilare il codolo
	Ovalizzazione dell'utensile	Sostituire o riaffilare l'utensile
	Avanzamento o velocità di taglio troppo elevate	Riaffilare a specifica
	Avanzamento o velocità di taglio troppo elevate	Correggere i parametri di taglio secondo il catalogo o il Selector.
Foro sottodimensionato	Insufficiente sovrametallo da rimuovere	Aumentare il quantitativo di sovrametallo da asportare
	Eccessivo sviluppo di calore in fase d'alesatura. Il foro prima si dilata e poi si contrae.	Aumentare il flusso di refrigerante
	Il diametro dell'utensile è usurato e sotto misura.	Riaffilare a specifica.
	Avanzamento o velocità di taglio troppo basse	Correggere I parametri di taglio secondo il catalogo o il Selector
	Preforo troppo piccolo	Diminuire il quantitativo di sovrametallo da asportare
Fori ovali e conici	Il mandrino della macchina è instabile	Eseguire rettifica mandrino
	Disallineamento tra utensile e foro	Utilizzare un alesatore per chiodi
	Angolo di smusso asimmetrico	Riaffilare a specifica.
Cattiva finitura del foro	Eccessivo sovrametallo da rimuovere	Diminuire il quantitativo di sovrametallo da asportare
	Utensile danneggiato	Riaffilare a specifica.
	Angolo di taglio troppo piccolo	Riaffilare a specifica.
	Emulsione o olio da taglio troppo diluito	Aumentare % di concentrazione
	Avanzamento o velocità di taglio troppo basse	Correggere i parametri di taglio secondo il catalogo o il Selector
	Velocità di taglio troppo elevata	Correggere i parametri di taglio secondo il catalogo o il Selector
L'utensile si incolla e si rompe	Utensile danneggiato	Riaffilare a specifica.
	Rastrematura posteriore dell'utensile insufficiente	Verificare e sostituire/ modificare l'utensile
	La larghezza del bordino è eccessiva	Verificare e sostituire/ modificare l'utensile
	Il materiale tende a comprimersi	Usare un alesatore centesimale per compensare la variazione
	Pre-foro troppo piccolo	Diminuire lo spessore di sovrametallo da asportare
	Materiale eterogeneo con inclusioni d'elevata durezza	Usare un alesatore in metallo duro

FILETTATURA

INFORMAZIONI GENERALI SULLA MASCHIATURA

Il successo di ogni operazione di filettatura dipende da vari fattori, che insieme influenzano la qualità del prodotto finito.

1. Selezionare il tipo di maschio più idoneo al tipo di materiale da lavorare e al tipo di foro, cioè passante o cieco, dalla tabella di classificazione dei materiali.
2. Assicurarsi che il pezzo da lavorare sia bloccato saldamente – movimenti laterali possono causare la rottura del maschio o filetti di qualità scadente.
3. Scegliere il formato corretto della punta dalla rispettiva pagina del catalogo. Garantire sempre che l'incrudimento del materiale del componente sia mantenuto al minimo.
4. Selezionare la velocità di taglio più consona, come riportato sulla pagina del catalogo dedicata al prodotto.
5. Utilizzare il refrigerante idoneo per il tipo di applicazione.
6. In applicazioni CN assicurarsi che la velocità d'avanzamento sia corretta. In caso si utilizzi un mandrino portamaschio a compensazione si raccomanda un avanzamento pari al 95 - 97% del passo, per permettere al maschio di generare il proprio passo.
7. Dove possibile, bloccare saldamente il maschio con un mandrino porta-maschio di buona qualità e con limitazione della coppia massima, al fine di permettere un movimento assiale libero del maschio stesso, e assicurarsi che l'utensile si presenti perpendicolare al foro. Questo tipo di mandrino protegge inoltre il maschio da rotture, nel caso dovesse accidentalmente urtare contro il fondo di un foro cieco.
8. Assicurarsi che il maschio entri dolcemente nel foro: un avanzamento sbagliato può causare fenomeni di "imboccatura a campana" (bell mouthing).

TABELLA CLASSI DI TOLLERANZA DEL MASCHIO CONTRO TOLLERANZA DELLA FILETTATURA INTERNA (MADREVITE)

Classe Tolleranza, Maschio			**Tolleranza, Filettatura Interna (Madrevite)**					**Applicazione**
ISO	DIN	ANSI BS						
ISO 1	4 H	3 B	4 H	5 H				Accoppiamento preciso senza gioco
ISO 2	6 H	2 B	4 G	5 G	6 H			Accoppiamento normale
ISO 3	6 G	1 B			6 G	7 H	8 H	Accoppiamento con tolleranza ampia
-	7 G	-				7 G	8 G	Accoppiamento con gioco per successivo trattamento o rivestimento

Risoluzione dei problemi durante la Filettatura con Maschi

PROBLEMA	CAUSA	SOLUZIONE
Filettatura maggiorata	Tolleranza non corretta	Scegliere un maschio con tolleranza di filettatura inferiore
	Avanzamento assiale non corretto	Ridurre l'avanzamento del 5-10% o aumentare la compressione del mandrino porta maschio
	Tipo di maschio non adatto all'applicazione	Usare un maschio con imbocco corretto per fori passanti o un maschio con scanalature elicoidali per fori ciechi. Usare un utensile rivestito per prevenire la formazione del tagliente di riporto. Consultare il catalogo o il Web Selector per l'alternativa più idonea
	Maschio non centrato sul foro	Verificare le condizioni del mandrino porta-maschio e posizionare il centro del maschio sul foro
	Mancanza di lubrificazione	Assicurare una buona lubrificazione per prevenire la formazione del tagliente di riporto. Consultare la sezione sulla lubrificazione nel nostro manuale tecnico.
	Velocità di taglio del maschio troppo bassa	Seguire le raccomandazioni del catalogo/ Web Selector
Filettatura minorata	Tipo di maschio non adatto all'applicazione	Usare un maschio con imbocco corretto per fori passanti o un maschio con scanalature elicoidali per fori ciechi. Usare un utensile rivestito per prevenire la formazione del tagliente di riporto. Usare un maschio con angolo di taglio maggiore. Consultare il catalogo o il Web Selector per l'alternativa più idonea
	Tolleranza non corretta	Scegliere un maschio con tolleranza di filettatura maggiore, in particolare su materiali con bassa tendenza a creare filettature maggiorate (*oversize*), quali ghisa o acciaio inossidabile
	Lubrificazione non corretta o mancante	Assicurare una buona lubrificazione per prevenire l'intasamento del truciolo nel foro. Consultare la sezione sulla lubrificazione nel nostro manuale tecnico.
	Diametro di pre-foro troppo piccolo	Aumentare il diametro di pre-foro sino al valore massimo permesso. Verificare le tabelle dei prefori di maschiatura.
	Il materiale si richiude dopo la maschiatura	Consultare il catalogo o il *Web Selector* per scegliere l'utensile appropriato.
Scheggiatura	Tipo di maschio non adatto all'applicazione	Scegliere un maschio con angolo di taglio più basso e/o con imbocco spogliato più lungo. Usare un maschio con imbocco corretto per fori passanti o un maschio con scanalature elicoidali per fori ciechi, in modo da evitare l'intasamento dei trucioli nel foro. Usare un utensile rivestito per prevenire la formazione del tagliente di riporto. Consultare il catalogo o il Web Selector per l'alternativa più idonea.
	Lubrificazione non corretta o mancante	Assicurare una buona lubrificazione per evitate la formazione del tagliente di riporto. Consultare la sezione sulla lubrificazione nel nostro manuale tecnico.
	Il maschio urta contro il fondo del foro	Aumentare la profondità di foratura o diminuire la profondità di filettatura.
	Incrudimento superficiale del materiale lavorato	Ridurre la velocità, usare utensili rivestiti, assicurare una corretta lubrificazione. Consultare la sezione sulla lavorazione dell'acciaio inossidabile nel nostro manuale tecnico.
	Truciolo intrappolato durante la fase di ritorno	Evitare un'inversione improvvisa della rotazione del maschio.
	L'imbocco urta contro l'entrata del foro	Verificare la posizione assiale e ridurre l'errore assiale del centro del maschio rispetto al centro del foro.
	Diametro di pre-foro troppo piccolo	Aumentare il diametro di pre-foro sino al valore massimo permesso. Verificare le tabelle dei prefori di maschiatura.

Risoluzione dei problemi durante la Filettatura con Maschi

PROBLEMA	CAUSA	SOLUZIONE
Rottura	Maschio usurato	Usare un maschio nuovo o riaffilare il vecchio.
	Mancanza di lubrificazione	Assicurare una buona lubrificazione per evitare la formazione del tagliente di riporto e l'intasamento dei trucioli. Consultare la sezione sulla lubrificazione nel nostro manuale tecnico.
	Maschio urta contro il fondo del foro	Aumentare la profondità di foratura o diminuire la profondità di filettatura.
	Velocità di taglio del maschio troppo elevata	Ridurre la velocità di taglio. Seguire le raccomandazioni sul catalogo o sul Web Selector.
	Incrudimento superficiale del materiale lavorato	Ridurre la velocità. Usare utensili rivestiti. Assicurare una buona lubrificazione. Consultare la sezione sulla lavorazione dell'acciaio inossidabile nel nostro manuale tecnico.
	Diametro di pre-foro troppo piccolo	Aumentare il diametro di pre-foro sino al valore massimo permesso. Consultare le tabelle di riferimento.
	Coppia troppo alta	Usare un mandrino porta-maschio con frizione per la regolazione della coppia.
	Il materiale si richiude dopo la maschiatura	Seguire le raccomandazioni sul catalogo o sul Web Selector per l'utensile più idoneo.
Usura rapida	Tipo di maschio non adatto all'applicazione	Usare un maschio con angolo di taglio più basso e/o spoglia radiale più alta e/o imbocco più lungo. Usare un utensile rivestito. Consultare il catalogo o il Web Selector per l'alternativa più idonea.
	Mancanza di lubrificazione	Assicurare una buona lubrificazione per prevenire la formazione del tagliente di riporto e l'insorgere di stress termici sul tagliente. Consultare la sezione sulla lubrificazione nel nostro manuale tecnico.
	Velocità di taglio del maschio troppo elevata	Ridurre la velocità di taglio. Seguire le raccomandazioni riportate sul catalogo e sul Web Selector.
Tagliente di riporto	Tipo di maschio non adatto all'applicazione	Usare un maschio con un angolo di taglio più basso e/o con spoglia radiale più alta. Consultare il catalogo o il Web Selector per l'utensile più idoneo.
	Mancanza di lubrificazione	Assicurare una buona lubrificazione per evitare la formazione del tagliente di riporto. Consultare la sezione sulla lubrificazione nel nostro manuale tecnico.
	Trattamento superficiale non idoneo	Scegliere un maschio con rivestimento raccomandato.
	Velocità di taglio del maschio troppo bassa	Seguire le raccomandazioni sul catalogo o sul Web Selector.

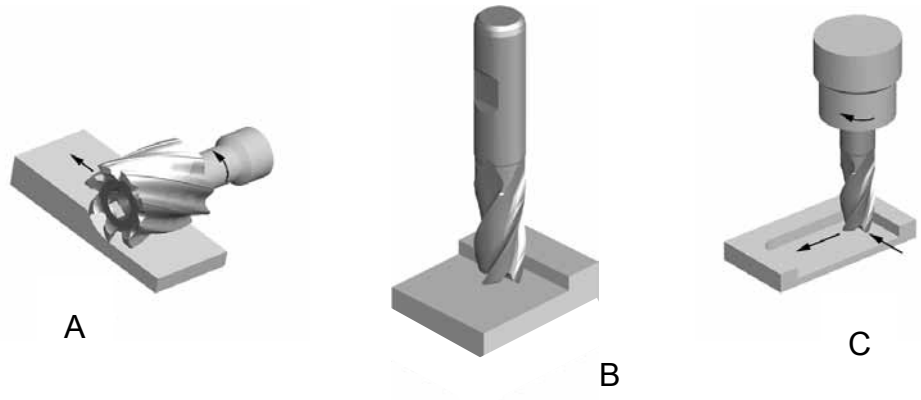
Fresatura

Informazioni Generali sulla Fresatura

L'operazione di fresatura consiste nell'asportazione di materiale (sotto forma di truciolo) attraverso un movimento rotatorio dell'utensile fresa associato ad un movimento di avanzamento affidato al pezzo in lavoro o all'utensile stesso. La fresa è per definizione un utensile di rotazione dotato di un numero definito di taglienti, i quali entrano in contatto in maniera sequenziale con il pezzo il lavorazione.

TIPI DI FRESE

Le tre operazioni di fresatura di base sono descritte qui di seguito: (A) fresatura periferica, (B) fresatura frontale e (C) fresatura periferico - frontale.



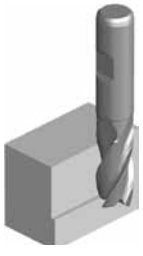
Nella fresatura periferica l'asse di rotazione della fresa è parallelo alla superficie in lavoro. La fresa è munita di una serie di denti disposti lungo la circonferenza, ogni dente agisce come un utensile da taglio a punta singola, definito fresa semplice. Le frese impiegate nella fresatura periferica possono essere dotate di denti diritti o elicoidali.

Nella fresatura frontale la fresa è montata su di un mandrino che ruota lungo un asse perpendicolare alla superficie in lavoro. I taglienti principali sono disposti in corrispondenza della base del corpo cilindrico fresa.

Nella fresatura periferico - frontale l'utensile fresa è dotato di taglienti principali (normalmente di tipo elicoidale) posizionati sulla superficie cilindrica, e di taglienti secondari posizionati frontalmente in corrispondenza della base cilindrica.

APPLICAZIONI

L'MRR ed i vari tipi di lavorazione sono fra loro strettamente legati. Ogni tipo di lavorazione è caratterizzata da un MRR specifico, il quale varia a seconda dei parametri di lavoro utilizzati: profondità assiale e radiale, avanzamento utensile. Il catalogo Dormer identifica le diverse applicazioni con l'ausilio di icone.

Finitura/semifinitura	Contornatura di sgrossatura	Fresatura di cave (*)	Fresatura "a Tuffo"	Fresatura a Rampa
				


La profondità radiale del taglio deve essere pari a 0.1 del diametro nominale fresa per operazioni di finitura e pari a 0.25 per fresatura di semifinitura.	La profondità radiale del taglio deve essere non superiore a 0.9 del diametro utensile.	La profondità radiale di taglio è pari al diametro della fresa.	Utilizzando frese con taglienti al centro è possibile effettuare operazioni di foratura. Nota: maggiori informazioni all'interno del paragrafo strategie di foratura.	L'utensile fresa è dotato di 2 movimenti combinati: assiale e radiale. Nota: maggiori informazioni all'interno del paragrafo riguardante le strategie di foratura.

Risoluzione dei Problemi durante la Fresatura

PROBLEMA	CAUSA	SOLUZIONE
Rottura	Eccessivo materiale asportato nell'unità di tempo (carico tagliente troppo elevato)	Diminuire l'avanzamento per dente
	Avanzamento troppo veloce	Ridurre avanzamento
Usura	Lunghezza tagliente o sporgenza utensile eccessiva	Posizionare codolo più in profondità all'interno del mandrino portautensili, usare una fresa più corta
	Materiale in lavoro caratterizzato da bassa lavorabilità	Consultare il catalogo o il Web Selector per definire l'utensile ed I parametri più idonei
	Avanzamento e velocità non corretti	Consultare il catalogo o il Web Selector per definire I parametri più idonei
	Scarsa rimozione del truciolo	Posizionare correttamente gli ugelli del lubrorefrigerante
	Fresatura convenzionale	Fresatura concorde
	Geometria – materiale – rivestimento utensile	Consultare il catalogo o il Web Selector per utensili più adeguati
Scheggiatura	Avanzamento utensile troppo alto	Ridurre avanzamento
	Vibrazione utensile	Ridurre il numero di giri/minuto
	Velocità di taglio bassa	Aumentare il numero di giri/minuto
	Aumentare il numero di giri/minuto	Fresatura concorde
	Bassa rigidità dell'utensile	Posizionare il codolo più in profondità all'interno del mandrino portautensili, usare una fresa più rigida (maggiore numero denti, minore lunghezza, massimo diametro utensile adottabile). Utilizzare sistemi porta utensili più rigidi (es.: calettamento a caldo)
	Rigidità del pezzo	Serrare bene il pezzo
Vita utensile breve	Materiale difficile da lavorare	Consultare il catalogo o Web Selector per un'alternativa di utensile più idonea
	Angolo di spoglia frontale o dorsale non idonei	Scegliere utensile con geometria adeguata
	Eccessiva temperatura raggiunta dai taglienti in lavoro	Usare un utensile rivestito
Scarsa finitura superficiale	Avanzamento troppo elevato	Ridurre l'avanzamento utensile
	Velocità di taglio troppo bassa	Aumentare la velocità di taglio
	Truciolo irregolare	Diminuire il quantitativo di sovrametallo asportato
	Usura eccessiva utensile	Sostituire o riaffilare l'utensile
	Formazione di tagliente di riporto	Utilizzare geometria idonea (angolo elica, angolo di spoglia dorsale e frontale)
	Saldatura del truciolo sui taglienti in lavoro	Aumentare il quantitativo di refrigerante

PROBLEMA	CAUSA	SOLUZIONE
Scarsa precisione dimensionale del pezzo lavorato	Flessione dell'utensile	Posizionare il codolo più in profondità all'interno del mandrino portautensili, usare una fresa più rigida (maggiore numero denti, minore lunghezza, massimo diametro utensile adottabile)
	Numero insufficiente di taglienti.	Usare un utensile con più taglienti.
	Portautensili usurato	Riparare o sostituire il portautensili
	Scarsa rigidità del portautensili	Sostituire con portautensili più rigido (es.: calettamento a caldo)
	Scarsa rigidità del mandrino	Usare mandrino di maggiori dimensioni
Vibrazione utensile	Avanzamento e velocità troppo elevate	Correggere avanzamento e velocità con l'ausilio del catalogo/ Web Selector
	Lunghezza tagliente o sporgenza utensile eccessiva	Posizionare il codolo più in profondità all'interno del mandrino portautensili, usare una fresa più corta
	Profondità assiale troppo elevata	Ridurre la profondità assiale
	Scarsa rigidità (sistema complessivo macchina e portautensili)	Verificare il portautensili e sostituirlo se necessario

BOHREN

ALLGEMEINE HINWEISE ZUM BOHREN

1. Die Auswahl des besten Bohrers für die Anwendung erfolgt unter Berücksichtigung des zu bearbeitenden Materials, Eigenschaft des Werkzeugs und der Kühlung.
2. Immer auf maximale Stabilität achten, da Instabilitäten des Werkstückes und/oder der Werkzeugspindel den Bohrer, das Werkstück sowie die Maschine beschädigen können. Es sollte immer der kürzest mögliche Bohrer gewählt werden.
3. Werkzeugspannung ist ein wichtiger Aspekt beim Bohrvorgang. Der Bohrer darf sich keinesfalls im Werkzeughalter auf irgendeine Art bewegen.
4. Die Nutzung geeigneter Kühl- und Schmiermittel je nach Bohrvorgang ist empfehlenswert. Beim Einsatz von Kühl- und Schmiermitteln auf eine ausgiebige Zufuhr achten, besonders an der Bohrerspitze.
5. Der Spanabtransport beim Bohren ist entscheidend, um einen korrekten Bohrvorgang zu gewährleisten. Ein Spanstau in den Nuten muss vermieden werden.
6. Beim Nachschleifen eines Bohrers immer darauf achten, dass die korrekte Spitzengeometrie erzeugt und Verschleiß entfernt wurde.

BOHRUNGSGRÖSSE

In dem Maße wie Geometrien, Trägermaterialien und Beschichtungen weiterentwickelt werden, erreicht man immer präzisere Bohrungsgrößen. Allgemein erreicht ein Werkzeug mit Standardgeometrie eine Bohrungsgröße bis H12. Für komplexere Bohrerkonfigurationen können unter günstigen Bedingungen H8-Bohrungstoleranzen realisiert werden. Für eine bessere Übersicht sind im folgenden die Produkttypen und ihre erreichbaren Bohrungstoleranzen aufgelistet:

- HSS Standardbohrer – H12
- HSS / HSS-E Tieflochbohrer mit parabolischen Nuten – H10
- Beschichtete Hochleistungs VHM-Bohrer – H8/H9

STRATEGIE FÜR DAS TIEFLOCHBOHREN

Bei großen Bohrtiefen kann die nötige Tiefe mit verschiedenen Methoden erreicht werden. Das folgende Beispiel zeigt vier Wege, eine Bohrung von 10xD Tiefe zu erzeugen.

	Serienbohrung	Serienbohrung
Bohreranzahl	3 (2,5xD, 6xD,10xD)	2 (2,5xD,10xD)
Bohrertyp	Standardgeometrie, allgemeine Verwendung	Standardgeometrie, allgemeine Verwendung
+ / -	Teuer Zeitaufwendig	Kostengünstiger Schnell

	Bohren mit Entspanen	Bohren ohne Entspanen
Bohreranzahl	1 (10xD)	1 (10xD)
Bohrertyp	Standardgeometrie, allgemeine Verwendung	Anwendung spezifische Werkzeuge
+ / -	Zeitaufwendig	Kostengünstig Schnell

FEHLERSUCHE BEIM BOHREN

PROBLEM	URSACHE	ABHILFE
Abgebrochene oder verformte Mitnehmer	Schlechter Sitz zwischen Schaft und Spannmittel	Schaft und Spannmittel sauber und unbeschädigt halten
Riss im Kern	Vorschub zu hoch	Vorschub bis zum optimalen Wert verringern
	Zu wenig Hinterschliff	Nach korrekter Spezifikation nachschleifen
	Kernausspitzung zu stark	Nach korrekter Spezifikation nachschleifen
	Schlag auf die Querschneide	Schlag auf die Querschneide vermeiden. Morsekegelbohrer vorsichtig in die Spindel einsetzen bzw. austreiben
Eckenverschleiß	Überhöhte Drehzahl	Drehzahl auf das Optimum verringern - möglicherweise Erhöhung des Vorschubs
Ausbruch der Außenkanten	Instabile Arbeitsverhältnisse	Spindelspiel beseitigen
Ausbruch der Schneidkanten	Zu viel Hinterschliff	Nach korrekter Spezifikation nachschleifen
Bruch des Schaftauslaufs	“Abwürgen” der Nuten	Entspanen bzw. Serienbohrung anwenden
	Abrutschen des Bohrers	Sicherstellen, dass der Bohrer sicher in Spannfutter und Spindel sitzt
Spiralenförmiger Abschluss im Kernloch	Vorschub zu gering	Vorschub erhöhen
	Schlechte Positionsgenauigkeit	Bohrung vorher anzentrieren
Bohrungstoleranz zu groß	Falsche Spitzengeometrie	Spitzengeometrie prüfen
	Spanabfuhr nicht effektiv	Drehzahl, Vorschub und Bohrtiefe anpassen, um besseren Spanfluss zu erhalten

REIBEN

ALLGEMEINE HINWEISE ZUM REIBEN

Um die besten Ergebnisse bei der Benutzung von Reibahlen zu erzielen, ist es wichtig, dass sie zerspanen. Es ist ein typischer Fehler, die Bohrung, die gerieben werden soll, mit zu wenig Aufmaß vorzubereiten. Wenn vor dem Reiben zu wenig Material in der Bohrung verbleibt, wird die Reibahle anfangen zu schaben bzw. sehr schnell verschleißen, was zu einem geringeren Durchmesser führt. Es ist aber auch wichtig, nicht zu viel Material in der Bohrung zu belassen. (Siehe Materialabtrag weiter unten).

1. Den optimalen Reibahlen-Typ sowie die optimalen Drehzahlen und Vorschübe für die Anwendung auswählen. Die vorgebohrten Kernlöcher sollten den korrekten Durchmesser haben.

2. Das Werkstück muss fest eingespannt sein und die Maschinenspindel sollte kein Spiel haben.

3. Das Spannfutter für Reibahlen mit Zylinderschaft sollte über eine gute Qualität verfügen. Wenn die Reibahle bei automatischem Vorschub im Spannfutter rutscht, kann diese brechen.

4. Der Überhang vom Werkzeug zur Maschinenspindel sollte so gering wie möglich gehalten werden.

5. Empfohlene Schmiermittel verwenden, um eine möglichst hohe Standzeit des Werkzeugs zu erreichen. Darauf achten, dass es die Schnittkanten erreicht. Da Reiben keine schwere Schnittoperation darstellt, ist eine lösliche Öl 40:1-Verdünnung normalerweise zufriedenstellend. Bei Trockenbearbeitung in Grauguss kann mit Pressluft gearbeitet werden.

6. Die Nuten einer Reibahle dürfen nicht durch Späne blockiert werden.

7. Bevor die Reibahle nachgeschliffen wird, sollte die Rundlaufgenauigkeit zwischen den Zentrierbohrungen überprüft werden. In den meisten Fällen muss nur der Anschnitt nachgeschliffen werden.

8. Reibahlen scharf halten. Regelmäßiges Nachschleifen ist ökonomisch sinnvoll, allerdings ist es wichtig zu verstehen, dass die Reibahle nur mit dem Anschnitt schneidet, nicht mit der Fase. Aus diesem Grund muss nur der Anschnitt nachgeschliffen werden. Die Genauigkeit beim Nachschleifen ist wichtig für die Bohrungsqualität und Standzeit des Werkzeugs.

MATERIALABTRAG

Die empfohlene Materialmenge, die abgetragen werden soll, hängt vom Anwendungsmaterial und der Oberfläche der vorgebohrten Bohrung ab. Allgemeine Richtlinien für Materialabtrag werden in der folgenden Tabelle aufgelistet:

Größe der aufgeriebenen Bohrung (mm)	Wenn vorgebohrt	Wenn aufgebohrt
Unter 4	0.1	0.1
Über 4 bis 11	0.2	0.15
Über 11 bis 39	0.3	0.2
Über 39 bis 50	0.4	0.3

Größe der aufgeriebenen Bohrung (Zoll)	Wenn vorgebohrt	Wenn aufgebohrt
Unter 3/16	0.004	0.004
3/16 bis ½	0.008	0.006
½ bis 1,½	0.010	0.008
1,½ bis 2	0.016	0.010

TOLERANZGRENZEN

1. AUF DEM SCHNEIDENDURCHMESSER VON STANDARD-REIBAHLEN
   Der Durchmesser (d1) wird über die kreisförmige Fase hinweg direkt hinter dem Anschnitt oder der Kegelführung gemessen. Die Toleranz in Übereinstimmung mit der DIN 1420 ist dazu gedacht, H7 Bohrungen zu erzeugen.

REIBAHLEN-TOLERANZ			
Durchmesser (mm)		Toleranzgrenze (mm)	
Über	Bis einschließlich	Hoch +	Niedrig +
	3	0.008	0.004
3	6	0.010	0.005
6	10	0.012	0.006
10	18	0.015	0.008

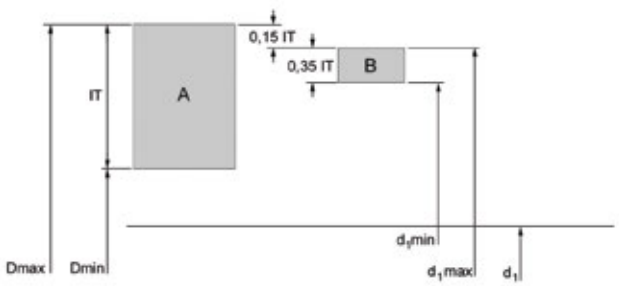
REIBAHLEN-TOLERANZ			
Durchmesser (mm)		Toleranzgrenze (mm)	
Über	Bis einschließlich	Hoch +	Niedrig +
18	30	0.017	0.009
30	50	0.021	0.012
50	80	0.025	0.014

2. BEI EINER H7 BOHRUNG
   Die normale Toleranz einer fertigen Bohrung ist H7 (siehe Tabelle unten). Für alle anderen Toleranzen können die Werte aus der Abbildung und der Tabelle unter Punkt 3 zur Berechnung des gewünschten Toleranzbereiches verwendet werden.

BOHRUNGSTOLERANZ			
Durchmesser (mm)		Toleranzgrenze (mm)	
Über	Bis einschließlich	Hoch +	Niedrig +
	3	0.010	0
3	6	0.012	0
6	10	0.015	0
10	18	0.018	0

BOHRUNGSTOLERANZ			
Durchmesser (mm)		Toleranzgrenze (mm)	
Über	Bis einschließlich	Hoch +	Niedrig +
18	30	0.021	0
30	50	0.025	0
50	80	0.030	0

3. Diese Tabelle kann zur Definition der Dimensionen einer speziellen Reibahle genutzt werden, um gemäß einer spezifischen Toleranz zu zerspanen, z. B. D8.



A = Bohrungstoleranz
B = Reibahlen-Toleranz
IT = Toleranzbereich
Dmax = Maximaler Bohrungsdurchmesser
Dmin = Minimaler Bohrungsdurchmesser
d_1 = Nominaler Durchmesser
$d_1$max = Maximaler Durchmesser der Reibahle
$d_1$min = Minimaler Durchmesser der Reibahle

	Durchmesser Toleranzbereich (mm)							
Toleranzbereich (Mikron)	Über 1 bis 3	Über 3 bis 6	Über 6 bis 10	Über 10 bis 18	Über 18 bis 30	Über 30 bis 50	Über 50 bis 80	Über 80 bis 120
IT5	4	5	6	8	9	11	13	15
IT6	6	8	9	11	13	16	19	22
IT7	10	12	15	18	21	25	30	35
IT8	14	18	22	27	33	39	46	54

IT12	100	120	150	180	210	250	300	350

z. B. 10 mm Bohrung mit Toleranz D8; Maximaler Bohrungsdurchmesser = 10,062; Minimaler Bohrungsdurchmesser = 10,040; Bohrungstoleranz (IT8) = 0,022

Maximalgrenze: 0,15 x Bohrungstoleranz (IT8) = 0,0033; aufgerundet = 0,004
Minimalgrenze: 0,35 x Bohrungstoleranz (IT8) = 0,0077; aufgerundet = 0,008

Maximalgrenze für Reibahle = 10,062 - 0,004 = 10,058
Minimalgrenze für Reibahle = 10,058 - 0,008 = 10,050

FEHLERSUCHE BEIM REIBEN

PROBLEM	URSACHE	ABHILFE
Abgebrochene oder verdrehte Mitnehmer	Inkorrekter Sitz zwischen Schaft und Spannmittel	Schaft und Spannmittel sauber und unbeschädigt halten
Schneller Werkzeugverschleiß	Zu wenig Aufmaß	Aufmaß vergrößern
Übermaß Bohrung	Übermäßige Schneidhöhen-Differenz	Nach korrekten Spezifikationen nachschleifen
	Kein korrekter Sitz in der Maschinenspindel	Spindel reparieren und Sitz korrigieren
	Beschädigungen am Werkzeughalter	Werkzeughalter ersetzen
	Werkzeugschaft ist beschädigt	Werkzeug ersetzen oder Schaft nachschleifen
	Rundlauffehler	Werkzeug ersetzen oder nachschleifen
	Asymmetrischer Anschnittwinkel	Nach korrekten Spezifikationen nachschleifen
	Vorschub oder Schnittgeschwindigkeit zu groß	Schnittbedingungen gemäß Katalog anpassen
Untermaß Bohrung	Zu wenig Aufmaß	Aufmaß vergrößern
	Zu große Hitzeentwicklung beim Reiben. Die Bohrung weitet sich und zieht sich wieder zusammen	Kühlmittelfluss erhöhen
	Der Werkzeugdurchmesser ist abgenutzt und Untermaß	Nach korrekten Spezifikationen nachschleifen
	Vorschub oder Schnittgeschwindigkeit zu gering	Schnittbedingungen gemäß Katalog anpassen
	Vorgebohrtes Kernloch zu eng	Aufmaß verringern
Ovale oder konische Bohrungen	Kein korrekter Sitz in der Maschinenspindel	Spindel reparieren und Sitz korrigieren
	Ausrichtungsfehler zwischen Werkzeug und Bohrung	Eine stirnschneidende Reibahle verwenden
	Asymmetrischer Anschnittwinkel	Nach korrekten Spezifikationen nachschleifen
Schlechte Oberflächenqualität der Bohrung	Zu viel Aufmaß	Aufmaß verringern
	Abgenutztes Werkzeug	Nach korrekten Spezifikationen nachschleifen
	Zu geringer Spanwinkel	Nach korrekten Spezifikationen nachschleifen
	Emulsion oder Bohröl zu stark verdünnt	Konzentration (%) erhöhen
	Vorschub und/oder Drehzahl zu gering	Schnittbedingungen gemäß Katalog anpassen
	Schnittgeschwindigkeit zu hoch	Schnittbedingungen gemäß Katalog anpassen
Das Werkzeug klemmt und zerbricht	Abgenutztes Werkzeug	Nach korrekten Spezifikationen nachschleifen
	Die “Halslänge” des Werkzeugs ist zu kurz	Werkzeug überprüfen und ersetzen/anpassen
	Die Breite der Fase ist zu groß	Werkzeug überprüfen und ersetzen/anpassen
	Werkstück-Material neigt zum Klemmen	Einstellbare Reibahle zur Kompensation der Toleranz benutzen
	Vorgebohrtes Kernloch zu eng	Aufmaß verringern
	Heterogenes Material mit Einschlüssen	Vollhartmetall-Reibahle verwenden

GEWINDEBOHREN

ALLGEMEINE HINWEISE ZUM GEWINDEBOHREN

Der Erfolg jeder Gewindebohroperation hängt von einer Anzahl Faktoren ab, welche alle die Qualität des fertigen Produktes beeinflussen.

1. Die korrekte Geometrie des Gewindebohrers aufgrund des zu bearbeitenden Materials und des Bohrungstyps (z. B. Durchgangs- oder Grundlochbohrung) aus der Materialklassifizierungstabelle wählen.
2. Das Werkzeug muss fest eingespannt sein - Rundlauffehler können zu einer schlechten Qualität des Gewindes und im schlimmsten Falle zu einem Bruch des Gewindebohrers führen.
3. Auswahl der korrekten Bohrergröße aus den Tabellen der entsprechenden Katalogseite. Eine Materialverhärtungen des zu fertigenden Bauteils sollte immer minimal gehalten werden.
4. Die korrekte Schnittgeschwindigkeit aus der Produktseite im Katalog wählen.
5. Das passende Kühlschmiermittel für die Anwendung benutzen.
6. Bei NC-Anwendungen sollten die Vorschubwerte für das gewählte Programm korrekt sein. Beim Einsatz einer Gewindebohr-Vorrichtung sollte der Vorschub auf 95% bis 97% der Steigung gewählt werden, damit der Gewindebohrer ohne Druck ins Material läuft.
7. Wenn man mit einer Gewindeschneidvorrichtung mit Kupplung arbeitet, ist es sehr wichtig, dass der Gewindebohrer ohne Druck und Zug arbeitet. Bei höherem Drehmoment schaltet die Kupplung ab (z. B. bei Berührung des Bohrungsgrundes).
8. Der Gewindebohrer sollte mit einem gleichmäßigen Vorschub in die Bohrung einlaufen, da ein ungleichmäßiger Vorschub zu einer ‘Gewindeflanken-Verschiebung’ führen kann.

TABELLE ÜBER GEWINDEBOHRER-TOLERANZ GEGENÜBER TOLERANZ INNENGEWINDEN (MUTTER)

Toleranz-Klasse, Gewindebohrer			**Toleranz, Innengewinde (Mutter)**					**Anwendung**
ISO	DIN	ANSI BS						
ISO 1	4 H	3 B	4 H	5 H				Untermaß
ISO 2	6 H	2 B	4 G	5 G	6 H			Normalmaß
ISO 3	6 G	1 B			6 G	7 H	8 H	Übermaß
-	7 G	-				7 G	8 G	Übermaß für nachträgliche Oberflächen-Behandlung oder Beschichtung

FEHLERSUCHE BEIM GEWINDEBOHREN

PROBLEM	URSACHE	ABHILFE
Übermaß	Nicht korrekte Toleranz	Gewindebohrer mit einer engeren Gewindetoleranz wählen
	Nicht den korrekten Axialvorschub gewählt	Vorschubrate um 5-10% verringern oder Anpressdruck der Gewindeschneidvorrichtung überprüfen
	Falscher Gewindebohrertyp für die Anwendung	Einen geradegenuteten Gewindebohrer mit Schälanschnitt für Durchgangsbohrung oder einen spiralgenuteten für Grundbohrungen benutzen. Eine Beschichtung am Werkzeug verhindert Aufbauschneidenbildung. Den Katalog oder den “Product Selector” für die entsprechende Werkzeugwahl nutzen.
	Gewindebohrer arbeitet nicht zentrisch	Halterung des Gewindebohrers überprüfen und das Zentrum des Gewindebohrers über der Bohrung positionieren
	Fehlende Schmierung	Gute Schmierung zur Vermeidung von Aufbauschneidenbildung verwenden. Siehe Schmiermittel Abschnitt im Technischen Handbuch.
	Gewindebohrgeschwindigkeit zu gering.	Den Empfehlungen im Katalog oder “Product Selector” folgen
Untermaß	Falscher Gewindebohrertyp für die Anwendung	Einen geradegenuteten Gewindebohrer mit Schälanschnitt für Durchgangsbohrungen oder einen spiralgenuteten für Grundbohrungen benutzen. Eine Beschichtung am Werkzeug verhindert Aufbauschneidenbildung. Gewindebohrer mit größerem Spiralwinkel verwenden. Den Katalog oder den “Product Selector” für die entsprechende Werkzeugwahl nutzen.
	Nicht korrekte Toleranz	Ein Gewindebohrer in einem höheren Toleranz-Feld sollte gewählt werden, besonders bei Material mit einer geringen Übermaß Tendenz, wie Gusseisen, Rostfreier Stahl
	Falsches oder fehlendes Schmiermittel	Gute Schmierung zur Vermeidung von Spanblockade in der Bohrung verwenden. Siehe Schmiermittel Abschnitt im Technischen Handbuch.
	Gewindekernbohrung zu eng	Bohrdurchmesser auf den maximalen Wert erhöhen. Mittels Kernlochtabelle prüfen.
	Zu enges Gewinde nach dem Gewindebohrvorgang	Den Empfehlungen für ein korrektes Werkzeug im Katalog oder “Product Selector” folgen
Ausbrüche am Werkzeug	Falscher Gewindebohrertyp für die Anwendung	Einen Gewindebohrer mit geringerem Spanwinkel benutzen. Einen Gewindebohrer mit einem längeren Anschnitt benutzen. Einen Gewindebohrer mit Schälanschnitt für Durchgangsbohrungen und einen spiralgenuten für Sacklöcher benutzen, um Spanblockaden zu vermeiden. Den Katalog oder den “Product Selector” für eine korrekte Werkzeugalternative zu Rate ziehen.
	Falsches oder fehlendes Schmiermittel	Gute Schmierung zur Vermeidung von Aufbauschneidenbildung verwenden. Siehe Schmiermittel Abschnitt im Technischen Handbuch.
	Gewindebohrer berühren den Bohrungsgrund	Kernbohrungstiefe vergrößern oder Gewindebohrtiefe verringern
	Oberflächenverhärtung	Geschwindigkeit verringern, beschichtetes Werkzeug benutzen, gutes Schmiermittel verwenden. Siehe Abschnitt zur Bearbeitung von rostfreiem Stahl im Technischen Handbuch.
	Spanblockade beim Reversieren	Umschaltpunkt von Rechts- auf Linkslauf beachten
	Anschnitt trifft auf Bohrungskante	Axiale Position überprüfen und den Axialfehler verringern.
	Gewindekernbohrung zu eng	Bohrdurchmesser auf den maximalen Wert erhöhen. Mittels Kernlochtabelle prüfen.

FEHLERSUCHE BEIM GEWINDEBOHREN

PROBLEM	URSACHE	ABHILFE
Gewindebohrer-Bruch	Zu starker Verschleiß des Gewindebohrers	Neuen Gewindebohrer verwenden oder den alten nachschleifen
	Fehlende Schmierung	Gute Schmierung zur Vermeidung von Aufbauschneidenbildung und Spanblockierungen verwenden. Siehe Schmiermittel Abschnitt im Technischen Handbuch.
	Gewindebohrer berühren den Bohrungsgrund	Kernloch-Tiefe vergrößern oder Gewindebohrtiefe verringern
	Zu enges Gewinde nach dem Gewindebohrvorgang	Schnittgeschwindigkeit verringern. Den Empfehlungen im Katalog oder “Product Selector” folgen.
	Oberflächenverhärtung	Geschwindigkeit verringern, beschichtetes Werkzeug benutzen, gutes Schmiermittel verwenden. Siehe Abschnitt zur Bearbeitung von Rostfreien Stahl im Technischen Handbuch.
	Gewindekernloch zu eng	Bohrdurchmesser auf den maximalen Wert erhöhen. Siehe Kernlochtabellen
	Zu hohes Drehmoment	Gewindeschneidvorrichtung mit einstellbarer Drehmoment-Kupplung verwenden.
	Materialverschluss nach dem Gewindebohren	Den Empfehlungen für ein korrektes Werkzeug im Katalog oder “Product Selector” folgen
Zu schneller Verschleiß	Falscher Gewindebohrertyp für die Anwendung	Gewindebohrer mit geringerem Spanwinkel und/oder stärkerem Drall und/oder längerem Anschnitt verwenden. Möglichst beschichtetes Werkzeug benutzen. Den Empfehlungen für ein korrektes Werkzeug im Katalog oder “Product Selector” folgen
	Fehlendes Schmiermittel	Gutes Schmiermittel verwenden um Aufbauschneidenbildung und thermische Belastung der Schneiden zu vermeiden. Siehe Schmiermittel Abschnitt im Technischen Handbuch.
	Gewindebohrgeschwindigkeit zu hoch	Schnittgeschwindigkeit verringern. Den Empfehlungen im Katalog oder “Product Selector” folgen.
Aufbau-schneidenbildung	Falscher Gewindebohrertyp für die Anwendung	Gewindebohrer mit geringerem Spanwinkel und/oder stärkerem Drall verwenden. Den Empfehlungen für ein korrektes Werkzeug im Katalog oder “Product Selector” folgen
	Fehlendes Schmiermittel	Ausreichende Schmierung verwenden um Aufbauschneiden zu vermeiden. Siehe Schmiermittel-Abschnitt im Technischen Handbuch.
	Oberflächenbehandlung ist nicht geeignet	Gewindebohrer mit geeigneter Oberflächenbehandlung wählen.
	Gewindebohrgeschwindigkeit zu gering	Folgen Sie den Empfehlungen des Katalogs oder “Product Selectors”

Fräsen

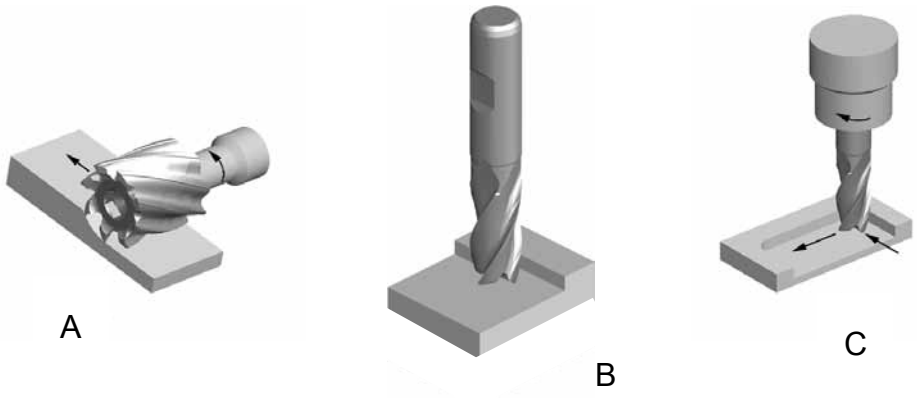
ALLGEMEINE HINWEISE ZUM FRÄSEN

Fräsen ist ein Bearbeitungsprozess, bei dem eine vorgegebene Menge Material durch einen sich relativ hochdrehenden Fräser mit einem entsprechenden Vorschub aus dem Werkstück entfernt wird.

Die charakteristische Eigenschaft des Fräsprozesses ist, dass jeder Zahn des Fräsers Material in Form von möglichst kleinen Spänen entfernt.

FRÄSER-TYPEN

Die drei grundlegenden Fräseroperationen werden unten gezeigt: (A) Abwälzfräsen, (B) Stirnfräsen und (C) Schaftfräsen.

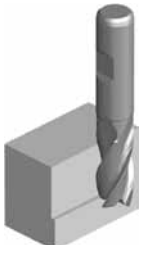


Beim Abwälzfräsen ist die Achse der Rotation parallel zur bearbeitenden Werkstückoberfläche ausgerichtet. Der Fräser hat eine Anzahl Zähne entlang des Kreisumfanges. Jeder Zahn agiert als Einzelschneide.
Fräser, die zum Abwälzfräsen genutzt werden, haben gerade oder spiralförmige Zähne. Beim Stirnfräsen wird der Fräser in eine Spindel aufgenommen.
Die Rotationsachse befindet sich senkrecht zur Werkstückoberfläche. Der Fräsvorgang wird duch die Stirnschneiden des Fräsers ausgeführt.

Beim Schaftfräsen rotiert der Fräser entlang der Achse vertikal zur Werkstückoberfläche. Es kann auch geneigt werden, um schräge Oberflächen zu bearbeiten. Das Werkzeug schneidet seitlich und es hat eine Stirnverzahnung.

ANWENDUNGEN

Der Zerspanungsquerschnitt und die Anwendung sind stark voneinander abhängig. Für alle unterschiedlichen Anwendungen gibt es unterschiedliche Zerspanungsquerschnitte. Im neuen Dormer Katalog wurden die Anwendungen mit einfachen Symbolen gekennzeichnet. Folgende Bearbeitungen sind möglich:

Umfangfräsen	Stirnfräsen	Nutenfräsen	Eintauchen	Schräg einfahren
				


Die radiale Frästiefe sollte kleiner als 0.25 x D des Schaftfräsers sein.	Die radiale Frästiefe sollte nicht mehr als 0.9 x D, die axiale Tiefe nicht weniger als 0.1 x D entsprechen.	Nutenfräsen. Die radiale Tiefe der Nute sollte nicht größer als der Durchmesser des Fräsers sein.	Nur stirnschneidende Werkzeuge benutzen. Vorschub halbieren.	Sowohl axiale als auch radiale Bearbeitung des Werkstückes möglich.

FEHLERSUCHE BEIM FRÄSEN

PROBLEM	URSACHE	ABHILFE
Bruch	Zu grosser Zerspanungsquerschnitt	Vorschub pro Zahn verringern
	Zu grosser Vorschub	Vorschub verringern
Abnutzung	Nuten- oder Gesamtlänge zu gross	Kürzer einspannen oder kürzeren Schaftfräser verwenden
	Werkstück-Material zu hart	Katalog oder Selector verwenden, um ein verschleissfesteres Werkzeugmaterial oder eine geeignetere Beschichtung zu wählen
	Vorschub und Drehzahl nicht korrekt	Korrekte Bearbeitungsparameter aus dem Katalog oder Selector wählen
	Schlechte Spanentfernung	Auf gute Kühlschmierung achten
	Gegenlauffräsen	Gleichlauffräsen
	Ungeeigneter Drallwinkel	Eine korrekte Werkzeugalternative siehe Katalog oder Selector verwenden
Schneidkanten-ausbrüche	Vorschubrate zu hoch	Vorschubrate reduzieren
	Vibrationen	Drehzahl reduzieren
	Geringe Bearbeitungsgeschwindigkeit	Drehzahl erhöhen
	Gegenlauffräsen	Gleichlauffräsen
	Werkzeugstabilität	Kürzeres Werkzeug wählen und/oder Werkzeug kürzer spannen
	Werkstückstabilität	Werkstück besser spannen
Kurze Werkzeug-standzeit	Materialverhärtung	Katalog oder Selector für korrekte Werkzeugalternative durchsuchen
	Ungeeigneter Span- und Hinterschliffwinkel	Werkzeug mit passendem Spanwinkel wählen
	Zu hohe Reibung	Beschichtetes Werkzeug benutzen
Schlechte Oberflächen-qualität	Zu hoher Vorschub	Auf korrekter Drehzahl verringern
	Drehzahl zu gering	Drehzahl erhöhen
	Zu große Späne	Zerspanungsquerschnitt verringern
	Werkzeug Verschleiß	Werkzeug ersetzen oder nachschleifen
	Aufbauschneidenbildung	Zu einem Werkzeug mit höherem Drallwinkel wechseln
	Schlechte Spanabfuhr	Kühlmittelfluss vergrößern

PROBLEM	URSACHE	ABHILFE
Werkstück-Ungenauigkeit	Werkzeugablenkung	Kürzeres Werkzeug wählen und/oder Werkzeug kürzer spannen
	Ungenügende Anzahl Nuten	Werkzeug mit mehr Zähnen verwenden
	Verschlissenes oder beschädigtes Spannfutter	Reparieren oder ersetzen
	Schlechte Spannfutterstabilität	Kürzeres oder stabileres Spannfutter verwenden
	Schlechte Stabilität der Spindel	Auf Stabilität der Spindel achten
Vibrationen	Vorschub und Geschwindigkeit zu hoch	Vorschub und Geschwindigkeit mit Hilfe des Katalogs oder Selectors korrigieren
	Nuten- oder Gesamtlänge zu groß	Kürzer einspannen oder kürzeren Schaftfräser verwenden
	Fräsentiefe zu groß	Frästiefe verringern
	Ungenügende Stabilität von Maschine und Spannmittel	Spannmittel überprüfen und wenn nötig wechseln

BOREN

ALGEMENE TIPS VOOR BOREN

1. Kies het beste type boor voor uw bewerking. Daarbij dienen het te boren materiaal, de mogelijkheden van de machine en de koeling in ogenschouw genomen te worden.
2. Instabiliteit van werkstuk en machinespindel kan schade aan het gereedschap tot gevolg hebben. Creëer altijd een stabiele opspanning. Dit kan ook worden bevorderd door de keuze van een zo kort mogelijke boor.
3. De houder waarin de boor moet worden opgespannen moet van een goede kwaliteit zijn. Als de boor in de houder slipt en de voeding automatisch is kan de boor breken.
4. Gebruik de aanbevolen koel- en smeermiddelen om de levensduur van de boor te verlengen. Zorg ervoor dat voldoende koel- en smeermiddel bij de boorpunt komt.
5. Een goede spaanafvoer is van essentieël belang. Voorkom ten allen tijde dat spaan kan ophopen in de spiraalgroef.
6. Zorg bij het herslijpen van de boor dat de originele geometrie weer hersteld wordt en dat de boor voldoende geslepen wordt zodat alle slijtage weg is.

GATTOLERANTIE

Naarmate het gereedschapmateriaal, de geometrie en de oppervlakte coatings verbeteren, is het mogelijk steeds nauwkeuriger gaten te boren. Normaal kan een standaard boor een gat boren met een H12 tolerantie. Nu kan met de huidige applicatie gereedschappen, onder de juiste omstandigheden H8 gehaald worden. Gattoleranties welke in het algemeen haalbaar zijn:

- HSS standaard boren – H12
- HSS / HSS-E Parabolische spaangroef diepgatboren – H10
- Volhardmetaal high performance gecoat bijv. – H8/H9

BEWERKINGSSTRATEGIE VOOR DIEPGATBOREN

Voor het boren van diepe gaten kunnen verschillende methodes toegepast worden om de gewenste diepte te bereiken. Onderstaand voorbeeld geeft vier manieren om een gat van 10xD te boren.

	Meerdere boren	Meerdere boren
Aantal gebruikte boren	3 (2,5xD, 6xD,10xD)	2 (2,5xD,10xD)
Type boor	Standaard geometrie, algemeen gebruik	Standaard geometrie, algemeen gebruik
+ / -	Duur Tijdrovend	Goedkoper Snel

	Lossend boren	Zonder te lossen boren
Aantal gebruikte boren	1 (10xD)	1 (10xD)
Type boor	Standaard geometrie, algemeen gebruik	Toepassingsgerichte boren
+ / -	Tijdrovend	Goedkoopst Snelst

PROBLEMEN EN OPLOSSINGEN BIJ BOREN

PROBLEEM	OORZAAK	OPLOSSING
Gebroken of gedraaide lip	Slecht contact tussen de morse conus en de spindel	Beschadigde spindel of morseconus
Gespleten over de ziel van de boor	Te hoge voeding	Reduceer de voeding naar de juiste waarde
	Onvoldoende vrijloop	Herslijp volgens specificatie
	Ziel te veel uitgedund	Herslijp volgens specificatie
	Punt van de boor hard gestoten	Voorkom het stoten van de boorpunt. Let op met het plaatsen en verwijderen van morseconus boren
Versleten hoeken van de snijkant (de neus)	Te hoge snijsnelheid	Reduceer de snijsnelheid naar een optimum – misschien kan de voeding verhoogt worden
Uitbreken van de hoeken van de snijkant	Onstabiliteit van het werkstuk	Verbeter de stabiliteit van het werkstuk
Afbrokkelen van de snijkant	Te grote vrijloop	Herslijp volgens specificatie
Breuk bij de uitloop van de spaangroef	Het vollopen van de spaangroef met spanen	Tijdig lossen of een diepgat boor toepassen
	De boor slipt in de houder	Voorkom dat de boor kan slippen in de houder of spindel
Spiraal vormige vertekening in de wand van het gat	Onvoldoende voeding	Verhoog de voeding
	Slechte centreer werking van de boor	Gebruik een centreerboor om aan te centreren
Overmaat van het geboorde gat	Geen juiste puntgeometrie	Controleer of de boor juist herslepen is
	Onvoldoende spaanafvoer	Pas de snelheid, voeding of de diepte tussen het lossen aan om de spanen beter af te voeren

RUIMEN

ALGEMENE TIPS VOOR RUIMEN

Om de beste resultaten te bereiken met ruimen is het essentieel om ze te laten “werken”. Het is een veel voorkomende fout dat bij de voorbereiding van ruimen te weinig materiaal voor het ruimen wordt overgelaten. Daardoor zal de ruimer meer gaan wrijven of schrapen in plaats van snijden, waardoor er veel onnodige slijtage en afwijking van de gewenste diameter optreed. Het is zeker zo belangrijk om niet teveel materiaal te laten staan, omdat dit ook de prestaties van de ruimer nadelig beinvloed. (Zie “Verspaand Volume” op de volgende pagina).

1. Selecteer het juiste type ruimer en de optimale voeding en snijsnelheid voor het te bewerken werkstuk. Zorg dat de voorgeboorde gaten de juiste diameter hebben.

2. Het werkstuk moet stabiel opgespannen zijn en de machine spil mag geen speling vertonen.

3. De opname waarin een ruimer met cilindrische schacht is opgespannen moet van goede kwaliteit zijn. Als de ruimer meedraait of slipt in de spantang tijdens een automatische voeding kan breuk van de ruimer het gevolg zijn.

4. Wanneer men een ruimer met een morseconus opspant in de bus, huls of de machinespil, gebruik dan altijd een hamer met een zachte kop. Zorg ervoor dat de morseconus en de bus, huls of machinespil schoon zijn en goed in elkaar passen, anders staat de ruimer uit het midden zodat overmaat een gevolg kan zijn.

5. Houd de uitsteeklengte van de ruimer ten opzichte van de machinespil zo kort mogelijk.

6. Gebruik aanbevolen smeermiddelen om de levensduur van de ruimer te bevorderen, en zorg dat het smeermiddel de snijkanten bereikt. Bij grijs gietijzer wordt, indien droogverspaand, perslucht aanbevolen.

7. Voorkom spaanophopingen in de spaangroeven van de ruimer.

8. Voordat de ruimer nageslepen wordt, moet men de rondloopnauwkeurigheid van de ruimer tussen de centers controleren. In veel voorkomende gevallen behoeft alleen de aansnijding geslepen te worden.

9. Houdt ruimers scherp. Regelmatig slijpen verzekert een economisch gebruik. Het is belangrijk te weten dat een ruimer slechts met de aansnijding snijdt en niet met de fasen. Daarom behoeft alleen deze kant herslepen te worden. Nauwkeurigheid van het slijpen is erg belangrijk voor de levensduur en de prestaties van het gereedschap.

VERSPANEND VOLUME

Het aanbevolen verspaand volume voor het ruimen is afhankelijk van het werkstuk-materiaal en de oppervlakte gesteldheid van het voorgeboorde gat. Algemene richtwaarden voor het verspaand volume zijn in de volgende tabellen weergegeven:

Diam. van het te ruimen gat (mm)	Voor-geboord	Voorgeboord met een opruimboor
Minder dan 4	0.1	0.1
Van 4 t/m 11	0.2	0.15
Van 11 t/m 39	0.3	0.2
Van 39 t/m 50	0.4	0.3

Diam. van het te ruimen gat (inch)	Voor-geboord	Voorgeboord met een opruimboor
Minder dan 3/16	0.004	0.004
3/16 t/m ½	0.008	0.006
½ t/m 1 ½	0.010	0.008
1 ½ t/m 2	0.016	0.010

TOLERANTIE

1. OP DE SNIJDENDE DIAMETER VAN STANDAARD RUIMERS

De diameter (d1) wordt gemeten over het cilindrische deel vlak achter de aansnijding. De tolerantie is in overeenstemming met DIN 1420 en is bedoeld voor het produceren van gaten met een tolerantie van H7.

RUIMER TOLERANTIE			
Diameter (mm)		Tolerantie (mm)	
Van	t/m	Hoog +	Laag +
	3	0.008	0.004
3	6	0.010	0.005
6	10	0.012	0.006
10	18	0.015	0.008

RUIMER TOLERANTIE			
Diameter (mm)		Tolerantie (mm)	
Van	t/m	Hoog +	Laag +
18	30	0.017	0.009
30	50	0.021	0.012
50	80	0.025	0.014

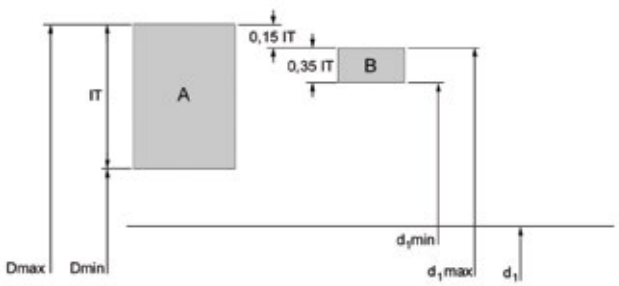
2. BIJ EEN H7 GAT

De meest voorkomende tolerantie voor een rond gat is H7 (zie tabel hieronder) Voor elke andere tolerantie kan de tabel en het model onder punt 3 gebruikt worden om de ruimer tolerantie en diameter te berekenen.

RUIMER TOLERANTIE			
Diameter (mm)		Tolerantie (mm)	
Van	t/m	Hoog +	Laag +
	3	0.010	0
3	6	0.012	0
6	10	0.015	0
10	18	0.018	0

RUIMER TOLERANTIE			
Diameter (mm)		Tolerantie (mm)	
Van	t/m	Hoog +	Laag +
18	30	0.021	0
30	50	0.025	0
50	80	0.030	0

3. Wanneer men de afmetingen van een speciale ruimer wil bepalen, die in een bepaalde tolerantie moet snijden, b.v . D8, kan men de beproefde tabel hieronder gebruiken.



A = Gat tolerantie
B = Ruimer tolerantie
IT = Tolerantie bereik
Dmax = Max. diameter van het gat
Dmin = Min. diameter van het gat
d_1 = Nominale diameter
$d_1$max = Max. diameter van de ruimer
$d_1$min = Min. diameter van de ruimer

Tolerantie bereik	Diameter tolerantie bereik							
	van 1 t/m 3	van 3 t/m 6	van 6 t/m 10	van 10 t/m 18	van 18 t/m 30	van 30 t/m 50	van 50 t/m 80	van 80 t/m 120
IT5	4	5	6	8	9	11	13	15
IT6	6	8	9	11	13	16	19	22
IT7	10	12	15	18	21	25	30	35
IT8	14	18	22	27	33	39	46	54
IT9	25	30	36	43	52	62	74	87
IT10	40	48	58	70	84	100	120	140
IT11	60	75	90	110	130	160	190	220
IT12	100	120	150	180	210	250	300	350

Voorbeeld van een 10 mm gat met een D8 tolerantie,
Maximum diameter van het gat = 10,062, Minimum diameter van het gat = 10,040, Gat tolerantie (IT8) = 0,022

Maximale tolerantie: 0,15 x gat tolerantie (IT8) = 0,0033, afgerond op 0,004
Minimale tolerantie: 0,35 x gat tolerantie (IT8) = 0,0077, afgerond op 0,008

Maximale tolerantie voor de ruimer = 10,062 – 0,004 = 10,058
Minimale tolerantie voor de ruimer = 10,058 – 0,008 = 10,050

PROBLEMEN / OORZAKEN / OPLOSSINGEN BIJ HET RUIMEN

PROBLEEM	OORZAAK	OPLOSSING
Gebroken of gedraaide lip	Onjuiste passing tussen schacht en opname	Zorg ervoor dat de schacht en de opname schoon en vrij van beschadigingen zijn.
Snelle slijtage	Te weinig verspaand volume	Verhoog het verspaand volume. Zie pag. 78-79.
Overmaats gat	Extreem hoogte verschil in snijkant diameter	Herslijp naar de juiste specificatie.
	Foutieve positie van de machinespindel	Repareer en herpositioneer de machine spindel.
	Beschadigingen aan de gereedschap-houder	Vervang de gereedschap-houder.
	Schacht van het gereedschap is beschadigd	Vervang het gereedschap of slijp de schacht.
	Onrondheid van het gereedschap	Vervang of herslijp het gereedschap.
	Assymetrische topaanschuining	Herslijpen naar de correcte specificatie.
	Te hoge voeding in verhouding tot de snijsnelheid.	Pas de snijwaarden aan volgens de snijgegevens in de Katalogus of de Product Selector.
Ondermaats gat	Onvoldoende hoeveelheid verspaand volume	Verhoog het verspaand volume. Zie pagina 78-79.
	Er word teveel hitte ontwikkeld tijdens het ruimen. Het gat krimpt en zet uit.	Vermeerder de koeling.
	De gereedschapdiameter is versleten en ondermaats	Herslijp tot correcte specificatie.
	Te lage voeding of snijsnelheid	Pas de snijwaarden aan volgens de snijgegevens in de Dormer Product Selector.
	Het voorgeboorde gat is te klein	Verminder de hoeveelheid verspaand volume. Zie pagina 78-79
Ovale en conische gaten	Foutieve positie van de machine spindel	Repareer en herpositioneer de machine spindel.
	Het gereedschap en het gat liggen niet in een lijn	Gebruik een opruimboor.
	Asymmetrische topaanschuinhoek	Herslijp naar correcte specificatie.
Slechte oppervlakte-gesteldheid van het gat	Overmatig verspaand volume	Verminder het verspaand volume. Zie pagina 78-79.
	Versleten gereedschap	Herslijp volgens specificatie.
	Te kleine snijkanthoek	Herslijp volgens specificatie.
	Te schrale emulsie of snijolie	Verhoog de concentratie.
	Snijsnelheid en/of voeding te laag	Pas de waarden aan volgens de gegevens in de Katalogus of de Dormer Product Selector.
	Snijsnelheid te hoog	Pas de waarden aan volgens de gegevens in de Katalogus of de Dormer Product Selector.
Het gereedschap klemt en breekt af	Versleten gereedschap	Herslijp volgens specificatie.
	De vrijloop van het gereedschap is te klein	Controleer en vervang het gereedschap, of pas het aan.
	De breedte van de fase is te groot	Controleer en vervang het gereedschap, of pas het aan.
	Het materiaal neigt tot klemmen	Gebruik een verstelbare ruimer om de tolerantie te compenseren.
	Het voorgeboorde gat is te klein	Verminder het verspaand volume.
	Harde plekken in het te bewerken materiaal	Gebruik een volhardmetaal ruimer.

DRAADSNIJDEN

ALGEMENE TIPS BIJ HET TAPPEN

Het succes van de tapbewerking hangt van een aantal factoren af, die alle de kwaliteit van het tapgat beïnvloeden.

1. Gebruik de juiste tap overeenkomstig het te bewerken materiaal en het type gat, d.w.z. blind of doorlopend, overeenkomstig de “Materiaalclassificatie” tabel.
2. Verzeker u van een goede opspanning van het werkstuk – verschuiven van het stuk kan tapbreuk of slechte draadkwaliteit tot gevolg hebben.
3. Selecteer de correcte maat van de boor op de betreffende pagina van de catalogus. Sluit zoveel mogelijk zelfharding van het werkstuk uit.
4. Gebruik de juiste snijsnelheid zoals deze vermeld wordt op de pagina van de productcatalogus.
5. Gebruik de juiste snijolie.
6. Bij NC-toepassingen dient de geprogrammeerde voeding juist te zijn. Bij gebruik van een tapkop met lengtecompensatie moet men 95% tot 97% van de spoed gebruiken teneinde de tap de mogelijkheid te geven zijn eigen spoed te genereren.
7. Indien mogelijk kan men de tap het best opspannen in een tapkop van goede kwaliteit voorzien van een slipkoppeling, zodat vrije axiale beweging mogelijk is. De slipkoppeling kan de tap ook tegen breuk beschermen wanneer het draaimoment te hoog wordt of de tap per vergissing de bodem van het gat zou raken bij het tappen van een blind gat.
8. Zorg ervoor dat de tap soepel in het gat kan komen omdat een onregelmatige voeding in het begin van gat kan resulteren in spoedverschil.

VERGELIJKINGSTABEL VOOR TOLERANTIES VAN TAPPEN EN TOLERANTIES VOOR BINNENDRAAD (MOER)

Tolerantieklasse, Tap			**Tolerantie, binnendraad (moer)**					**Gebruik**
ISO	DIN	ANSI BS						
ISO 1	4 H	3 B	4 H	5 H				Passend zonder speling
ISO 2	6 H	2 B	4 G	5 G	6 H			Normale passing
ISO 3	6 G	1 B			6 G	7 H	8 H	Passend met speling
-	7 G	-				7 G	8 G	Losse passing alvorens behandeling of coating

PROBLEMEN OPLOSSEN BIJ HET DRAADSNIJDEN

PROBLEEM	OORZAAK	OPLOSSING
Overmaat	Foutieve tolerantie	Kies een tap met een kleinere tolerantie.
	Foutieve voeding	Verminder de voeding met 5 a 10% of gebruik een lengtecompensatie in de taphouder.
	Verkeerde tap voor de toepassing	Gebruik gecoate tappen om materiaal opbouw op de snijkant te vermijden. Raad-pleeg de catalogus of de 'product selector' om een correct alternatief te vinden.
	Tap staat niet in lijn met het gat	Controleer de taphouder en de tappositie tegenover het gat.
	Geen smering	Gebruik een goede smering om opbouw van de snijkant te vermijden. Zie hoofdstuk van smeermiddelen in het technisch handboek.
	Snijsnelheid te laag	Gebruik de aanbevelingen in de catalogus / Product Selector.
Ondermaat	Verkeerde tap voor de toepassing	Gebruik een tap met schilaansnijding voor doorlopende gaten en een spiraaltap voor blinde gaten. Gebruik gecoate tappen om materiaal opgebouw op de snijkant te vermijden. Raad-pleeg de catalogus of de 'product selector' om een correct alternatief te vinden.
	Foutieve tolerantie	Kies een tap met een grotere tolerantie vooral in materialen die weinig tot geen overmaat vertonen zoals gietijzer en roestvast-staal.
	Foutieve of geen smering	Gebruik een goede smering om spaan-ophoping in het gat te vermijden. Zie ook het hoofdstuk aangaande smeermiddelen in het technisch handboek.
	Voorgeboord gat te klein	Vergroot de boordiameter tot het maximale toegestane. Meet na of het geboorde gat overeenkomt met de voorboormaat.
	Materiaal krimp na het tappen	Zie de catalogus/ productselector voor een goed alternatief.
Uitbrokkelen van de snijkant	Verkeerde tap voor de toepassing	Kies een tap met een kleinere spaanhoek. Kies een tap met een langere aansnijding. Gebruik spiraaltappen voor blinde gaten om te vermijden dat de spanen geblokkeerd geraken. Raadpleeg de catalogus of de productselector op alternatieve gereedschappen.
	Slechte of geen smering	Gebruik een goede smering teneinde materiaal opbouw op de snijkant. Zie ook het hoofdstuk 'smering' in het technisch handboek.
	Tap raakt de bodem van het gat	Vergoot de boordiepte of verminder de tapdiepte.
	Zelfhardend oppervlak	Verminder de snijsnelheid, gebruik gecoat gereedschap, gebruik een goede smering. Zie het hoofdstuk aangaande het bewerken van roestvast staal in het technisch handboek.
	Spaan klemt bij het terugkeren	Vermijd het plotseling terugdraaien van de tap.
	Aansnijding botst op het begin van het gat	Controleer de axiale positie van de tap tegenover de positie van het gat.
	Voorboordiameter te klein	Vergroot de voorboordiameter tot het maximale toegestane. Meet na of het geboorde gat overeenkomt met de voorboormaat.

PROBLEMEN OPLOSSEN BIJ HET DRAADSNIJDEN

PROBLEEM	OORZAAK	OPLOSSING
Breuk	Tap is versleten	Gebruik een nieuwe tap of herslijp de versleten tap.
	Te weinig smering	Smeer voldoende teneinde materiaal opbouw op de snijkanten tegen te gaan. Zie het hoofdstuk ‘smering en koeling’ in het technisch handboek.
	Tap raakt de bodem van het gat	Vergoot de boordiepte of verminder de tapdiept.
	Snijsnelheid is te groot	Verminder de snijsnelheid. Raadpleeg de catalogus of de productselector.
	Zelfhardend oppervlakte van het materiaal	Verminder de snijsnelheid. Gebruik gecoate gereedschappen en een goede smering. Zie ook het hoofdstuk aangaande het bewerken van roestvast staal in het technisch handboek.
	Voorboordiameter te klein	Vergroot de voorboordiameter. Zie de aanbevelingstabel.
	Te groot koppel	Gebruik een tapopname met instelbare slipkoppeling.
	Materiaal krimpt na het tappen	Kijk in de catalogus of de productselector voor een alternatieve tap.
Weinig standtijd	Verkeerde tap voor de toepassing	Gebruik een tap met een kleinere spaanhoek en/of een grote vrijloophoek en/of een langere aansnijding. Gebruik gecoat gereedschap. Raadpleeg de catalogus of de productselector voor het selecteren van het juiste gereedschap.
	Te weinig smeren	Gebruik een goede smering teneinde materiaal opbouw en spanningen op de snijkant te voorkomen. Zie het hoofstuk aangaande smering in het technisch handboek.
	Snijsnelheid te groot	Verminder de snijsnelheid. Volg de aanbevelingen in de catalogus of de productselector.
Materiaal opbouw	Verkeerde tap	Gebruik een tap met kleinere spaanhoek en/of een grotere vrijloop. Raadpleeg de catalogus of de productselector voor een goed alternatief.
	Te weinig smering	Gebruik een goede smering om materiaal opgebouw op de snijkant te voorkomen. Zie het hoofdstuk aangaande smering in het technisch handboek.
	Oppervlaktebehandeling is niet geschikt	Selecteer een tap die voorzien is met de aanbevolen oppervlaktebehandeling.
	Snijsnelheid is te laag	Volg de aanbevelingen in de catalogus of de productselector.

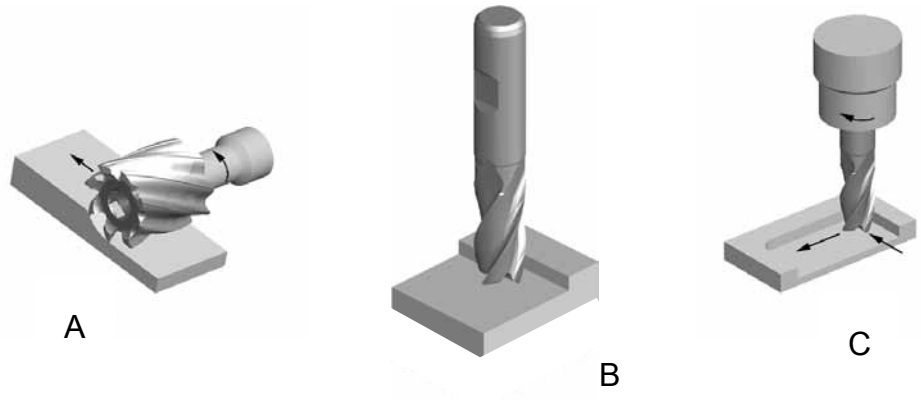
FREZEN

ALGEMENE ADVIEZEN VOOR FREZEN

Frezen is een bewerking waarbij met roterend gereedschap, eventueel in meerdere stappen, materiaal tot een opgegeven maat en oppervlaktekwaliteit wordt verspaant met een ten opzichte van het hoge toerental relatief langzame voeding.
De kenmerkende eigenschap van het freesproces is dat elke tand van de frees zijn deel van de hoeveelheid materiaal, in de vorm van kleine individuele spanen verwijdert.

TYPE FREESBEWERKINGEN

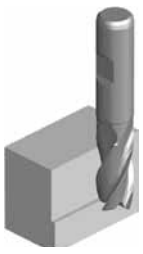
Er zijn, zoals hieronder getoond, in principe 3 soorten freesbewerkingen: (A) omtrek-frezen, (B) vlakfrezen en (C) vingerfrezen

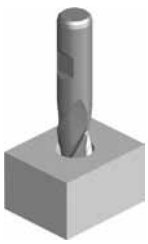


Bij omtrekfrezen ligt de hartlijn van de roterende frees parallel aan het werkstukoppervlakte. De tanden snijden elk afzonderlijk uitsluitend aan de omtrek of de mantel van de cilindrische frees, ook wel mantelfrees genoemd. Omtrekfrezen kunnen zijn uitgevoerd met rechte of hellende tanden. De frezen met hellende tanden verspanen soepeler dankzij het geleidelijk ingrijpen en uitlopen van de tanden.
Bij vlakfrezen staat de hartlijn van de frees loodrecht op het te bewerken oppervlakte, waarbij de freesbreedte kleiner is als de freesdiameter. Voor het op deze manier verspanen van een werkstuk heeft een vlakfrees kop- en omtrektanden.
De term vingerfrezen, voor de bewerking en het gereedschap, is afgeleid van de manier waarop men het oppervlakte van een beslagen glasplaat met een vinger beschrijft. De vingerfrees beweegt zich op eenzelfde wijze door het werkstukoppervlakte waarbij verschillende contouren kunnen ontstaan. De bewerking wordt om die reden ook wel contourfrezen genoemd. Een vingerfrees is kop- en omtreksnijdend.

SPECIFIEKE BEWERKING

et spaanvolume en de specifieke bewerking zijn afhankelijk van elkaar. Elke specifieke bewerking heeft zo zijn eigen snedediepte, -breedte en voeding en daarmee dus ook een navenant hoger of lager spaanvolume. In de huidige Dormer Catalogus zijn simpele symbolen opgenomen waarmee wordt aangegeven welke specifieke bewerking men kan doen, te weten het frezen van:

Uitsparingen	Vlakken	Spiebanen	Gaten	Hellingen
				




De snedebreedte zal <0.25xd moeten zijn.	De snedebreedte zal <0.9xd en de snedediepte <0.1xd moeten zijn.	Bij het frezen van spiebanen is de snedebreedte gelijk aan de diameter.	Met een centrum-snijdende frees kan men boren. De voeding vf moet in dit geval gedeeld worden door het aantal tanden.	Tegelijk radiaal en axiaal het werk-stuk binnen-dringen.

PROBLEMEN OPLOSSEN BIJ FREZEN

PROBLEEM	OORZAAK	OPLOSSING
Breuk	Te hoog spaanvolume	Verminder de voeding per tand
	Te hoge voeding	Verlaag de voeding
Slijtage	Snijkantlengte of de totale lengte is te lang	Kies een kortere frees en/of plaats de schacht verder in de houder
	Materiaal van het werkstuk is te hard	Selecteer een frees van het juiste materiaal en/of coating in de selector of de catalogus
	Onjuiste snijsnelheid en voeding	Controleer in de selector of catalogus de snijgegevens
	Slechte spaan afvoer	Verander de koelstralen van richting
	Tegenlopend frezen	Meelopend frezen
	Verkeerde spiraalhoek	Zoek in de selector of de catalogus naar een goed alternatief
Spaanvorming	Voeding te hoog	Verminder de voeding
	Trillingen	Verminder het toerental
	Lage snijsnelheid	Verhoog het toerental
	Tegenlopend frezen	Meelopend frezen
	Niet genoeg stabiliteit in de frees en opname	Kies een kortere frees en/of plaats de schacht verder in de houder
	Niet genoeg stabiliteit in de werkstukopspanning	Zet het werkstuk goed vast
Korte standtijd	Taai te bewerken materiaal	Zoek in de selector of catalogus naar een goed alternatief
	Foutieve spaanhoek en vrijloop	Wijzig de spaanhoek en vrijloop
	Wrijving van de frees/werkstuk	Gebruik een gecoate frees
Slechte oppervlakte-kwaliteit	Te hoge voeding	Verlaag voeding naar de juiste waarde
	Toerental te laag	Verhoog het toerental
	Happen in het materiaal	Verlaag het spaanvolume
	Frees slijtage	Vervang of herslijp de frees
	Opbouw aan de snijkant	Gebruik een frees met een grotere spiraalhoek
	Plakken van de spanen	Verhoog de hoeveelheid koelmiddelvloeistof

PROBLEEM	OORZAAK	OPLOSSING
Onnauw-keurig bewerkings-resultaat	Frees heeft te weinig snijkanten	Gebruik een frees met meer snijkanten
	Kies een kortere frees en/of plaats de schacht verder in de houder	Gebruik een frees met meer spaangroeven
	Versleten gereedschaphouder	Vervang of repareer de houder
	Niet genoeg stabiliteit in de gereedschaphouder	Vervang door een kortere gereedschaphouder
	Niet genoeg stabiliteit in de gereedschapspindel	Kies machine met grotere gereedschapspindel
Trilling	Voeding en toerental te hoog	Corrigeer de snijgegevens m.b.v. de selector of catalogus
	Totale – of snijkantlengte is te lang	Kies een kortere frees en/of plaats de schacht verder in de houder
	Te grote snedediepte	Verminder de snedediepte
	Niet genoeg stabiliteit in de werkstukopspanning	Controleer de gereedschaphouder, en vervang deze indien nodig

PERÇAGE

RECOMMANDATIONS GENERALES POUR LE PERÇAGE

1. Sélectionner le foret le plus approprié pour l'application, en gardant en mémoire le matériau à usiner, la capacité de la machine outil et l'huile de coupe utilisée.
2. La flexibilité entre la pièce et l'axe de la machine peut endommager le foret aussi bien que la pièce et la machine – il faut donc assurer un maximum de stabilité tout le temps. Ceci peut être amélioré en choisissant le foret le plus court possible pour l'application.
3. Le mandrin est un aspect important dans l'opération de perçage et le foret ne peut se permettre de casser ou de bouger du porte-outil.
4. Il est recommandé d'utiliser l'huile et les lubrifiants requis par l'opération de perçage. Lors de l'utilisation d'huiles ou de lubrifiants, il faut assurer un arrosage important, spécialement à la pointe du foret.
5. L'évacuation des copeaux durant le perçage est essentielle pour assurer une bonne opération de perçage. Ne jamais permettre aux copeaux des rester dans la goujure.
6. Lors du réaffûtage d'un foret, il faut toujours être sûr que la géométrie de pointe correcte est produite et que toute usure a été éliminée.

DIMENSION DE TROU

Plus les configurations de géométrie, de substrat et de revêtement sont avancées, plus la capacité d'un foret à produire un trou précis augmente. En général, un outil à géométrie standard produira un trou d'une tolérance H12. Cependant, étant donné que la configuration du foret devient plus complexe a la dimension du trou fini, dans des conditions favorables, peut se rapprocher de la tolérance H8. Pour offrir une plus grande précision, les types de produits et la tolérance des trous qu'ils réalisent sont listés ci-dessous :

- Forets HSS d'utilisation générale – H12
- Forets à goujure parabolique HSS / HSS-E pour trous profonds – H10
- Forets avec revêtement en carbure monobloc hautes performances – H8/H9

STRATEGIE DE PERÇAGE DE TROUS PROFONDS

Lors du perçage de trous profonds, il est possible d'utiliser différentes méthodes. L'exemple ci-dessous nous montre quatre possibilités de perçage de trous de 10 x le diamètre.

	Perçage en série	Perçage en série
No de forets	3 (2,5xD, 6xD,10xD)	2 (2,5xD,10xD)
Type de forets	Géométrie standard, utilisation générale	Géométrie standard, utilisation générale
+ / -	Coûteux Long	Plus rentable Rapide

	Perçage en plusieurs passes	Perçage en une seule passe
No de forets	1 (10xD)	1 (10xD)
Type de forets	Géométrie standard, utilisation générale	Outils d'utilisation spécifique
+ / -	Long	Rentable Rapide

PRESSION DE REFROIDISSEMENT INTERNE

Problème	Cause	Remède
Tenon cassé ou tordu	Mauvais contact entre la queue et le porte-outil	S'assurer du bon état de la queue et du porte-outil
Casse de l'âme	Avance trop élevée	Réduire l'avance à un taux optimum
	Dépouille initiale insuffisante	Réaffûter selon les spécifications correctes
	Amincissement de l'âme excessif	Réaffûter selon les spécifications correctes
	Lourd impact au niveau de la pointe du foret	Eviter tout impact au niveau de la pointe du foret. Faire attention lors de la mise en place ou de l'éjection des forets queue cône morse de l'axe
Usure des angles extérieurs	Vitesse excessive	Réduire la vitesse – peut-être augmenter l'avance
Casse des angles extérieurs	Pièce à usiner instable	Réduire le jeu de la pièce
Eclat des lèvres de coupe	Dépouille initiale excessive	Réaffûter selon les spécifications correctes
Casse de la goujure	Choc sur les goujures	Adopter un concept de perçage en plusieurs passes/ en série
	Glisse du foret	S'assurer que le foret est bien maintenu dans le mandrin et dans l'axe
Finition en spirale dans le trou	Avance insuffisante	Augmenter la vitesse de coupe
	Manque de précision dans le positionnement	Utiliser un foret de pré-perçage avant le perçage
Trou trop grand	Géométrie de pointe incorrecte	Vérifier la géométrie de pointe
	Mauvaise évacuation des copeaux	Ajuster la vitesse, l'avance et la longueur des passes pour obtenir une meilleure fragmentation des copeaux

ALESAGE

RECOMMANDATIONS GENERALES POUR L'ALESAGE

Pour obtenir les meilleurs résultats avec les alésoirs, il est important de les faire « travailler ». On fait souvent l'erreur de préparer les trous à aléser en y laissant une surépaisseur insuffisante. Si on ne laisse pas assez de surépaisseur dans le trou à aléser, le frottement entraîne une usure rapide de l'alésoir, avec pour conséquence une perte de diamètre. Pour de bons résultats, il est tout aussi important que la surépaisseur ne soit pas excessive. (Voir la section Enlèvement de matière ci-dessous).

1. Sélectionner le type d'alésoir le plus adapté ainsi que les conditions de vitesse de coupe et d'avance optimales pour l'application. Vérifiez que les trous percés ont un diamètre correct.

2. La pièce doit être maintenue de manière rigide et la broche de la machine ne doit pas avoir de jeu.

3. Le mandrin utilisé pour monter un alésoir à queue cylindrique doit être de bonne qualité. Si l'alésoir glisse dans le mandrin et si l'avance est automatique, l'alésoir risque de se casser.

4. Réduisez au minimum le porte-à-faux de l'outil par rapport à l'axe de la machine.

5. Utilisez les lubrifiants recommandés pour prolonger la durée de vie de l'alésoir et veillez à ce que le fluide atteigne toute les arêtes de coupe. Comme l'alésage n'est pas une opération de coupe difficile, une dilution 40:1 d'huile soluble convient généralement. De l'air comprimé peut être utilisé pour l'alésage à sec de la fonte grise.

6. Evitez le bourrage des copeaux dans les goujures d'un alésoir.

7. Avant d'affûter l'alésoir, vérifiez sa concentricité entre pointes. Dans la plupart des cas, seul le chanfrein d'entrée a besoin d'être réaffûté.

8. Veillez à ce que les alésoirs soient toujours bien affûtés. Un affûtage fréquent se justifie d'un point de vue économique, mais il ne faut pas oublier que les alésoirs ne coupent que sur le chanfrein et le cône d'entrée et non pas sur les listels de guidage. Par conséquent, seuls le chanfrein et le cône d'entrée doivent être réaffûtés. La précision de l'affûtage est importante tant pour la qualité du trou que pour la durée de vie de l'outil.

ENLEVEMENT DE SUREPAISSEUR

L'enlèvement de surépaisseur recommandé en alésage dépend du matériau de l'application et de la finition de surface du trou à aléser. Les recommandations de surépaisseur à enlever sont décrites dans les tableaux ci-dessous :

Diamètre du trou alésé (mm)	Sur avant trou au foret	Sur avant trou au foret aléseur
En dessous de 3/16	0.1	0.1
De 4 à 11	0.2	0.15
De 11 à 39	0.3	0.2
De 39 à 50	0.4	0.3

Diamètre du trou alésé (pouce)	Sur avant trou au foret	Sur avant trou au foret aléseur
En dessous de 3/16	0.004	0.004
3/16 à ½	0.008	0.006
½ à 1,½	0.010	0.008
1,½ à 2	0.016	0.010

ECARTS DE TOLERANCE

1. SUR LE DIAMETRE DE COUPE D'ALESOIRS STANDARD
   Le diamètre se mesure sur le listel de guidage juste derrière le chanfrein ou le cône d'entrée. La tolérance selon la DIN 1420 est destinée à produire des alésages H7.

TOLERANCE DE L'ALESOIR			
Diamètre (mm)		Ecart de tolérance (mm)	
Supérieur	Jusqu'à et y compris	Elevé +	Faible +
	3	0.008	0.004
3	6	0.010	0.005
6	10	0.012	0.006
10	18	0.015	0.008

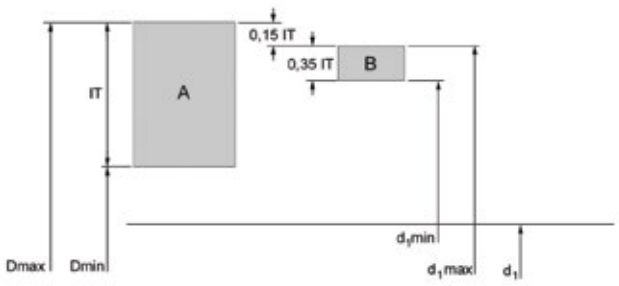
TOLERANCE DE L'ALESOIR			
Diamètre (mm)		Ecart de tolérance (mm)	
Supérieur	Jusqu'à et y compris	Elevé +	Faible +
18	30	0.017	0.009
30	50	0.021	0.012
50	80	0.025	0.014

2. SUR UN ALESAGE H7
   La tolérance la plus commune pour un trou fini est H7 (voir le tableau ci-dessous). Pour toute autre tolérance les données en dessous du point 3 peuvent être utilisées pour la calculer.

TOLERANCE DU TROU			
Diamètre (mm)		Ecart de tolérance (mm)	
Supérieur	Jusqu'à et y compris	Elevé +	Faible +
	3	0.010	0
3	6	0.012	0
6	10	0.015	0
10	18	0.018	0

TOLERANCE DU TROU			
Diamètre (mm)		Ecart de tolérance (mm)	
Supérieur	Jusqu'à et y compris	Elevé +	Faible +
18	30	0.021	0
30	50	0.025	0
50	80	0.030	0

3. Lorsqu'il est nécessaire de définir les dimensions d'un alésoir spécial destiné à produire une tolérance spécifique, par ex. D8, utilisez la formule suivante :



A = Tolerance du Trou
B = Tolerance de l'alésoir
IT = Amplitude de tolérance
Dmax = Diamètre de trou max
Dmin = Diamètre de trou min
d_1 = Diamètre nominal
$d_1$max = Diamètre max de l'alésoir
$d_1$min = Diamètre min de l'alésoir

	Amplitude de tolérance du diamètre (mm)							
Amplitude de tolérance (microns)	de 1 à 3	de 3 à 6	de 6 à 10	de 10 à 18	de 18 à 30	de 30 à 50	de 50 à 80	de 80 à 120
IT5	4	5	6	8	9	11	13	15
IT6	6	8	9	11	13	16	19	22
IT7	10	12	15	18	21	25	30	35
IT8	14	18	22	27	33	39	46	54
IT9	25	30	36	43	52	62	74	87
IT10	40	48	58	70	84	100	120	140
IT11	60	75	90	110	130	160	190	220
IT12	100	120	150	180	210	250	300	350

par ex. trou de 10 mm avec une tolérance D8, diam. max. = 10,062, diam. min. = 10,040, tol. alésage (IT8) = 0,022

Diamètre maximal : 0,15 x tolérance de l'alésage (IT8) = 0,0033, soit = 0,004
Diamètre minimal : 0,35 x tolérance de l'alésage (IT8) = 0,0077, soit = 0,008

Diamètre maximal de l'alésoir = 10,062 - 0,004 = 10,058
Diamètre minimal de l'alésoir = 10,058 - 0,008 = 10,050

INTERRUPTIONS LORS DE L'ALESAGE

Problème	Cause	Remède
Tenon cassé ou tordu	Mauvais contact entre la pince et la queue	S'assurer du bon état de la queue et de la douille
Usure rapide de l'outil	Enlèvement de matière insuffisant	Accroître la surépaisseur de matière
Trou surdimensionné	Variation excessive de la hauteur de lèvre	Réaffûter selon les spécifications correctes
	Jeu dans la broche de la machine	Réparer et rectifier l'axe
	Défaut du porte-outil	Remplacer le porte-outil
	Queue de l'outil endommagée	Remplacer ou réaffûter la queue
	Ovalisation de l'outil	Remplacer ou rectifier l'outil
	Angle de chanfrein d'entrée asymétrique	Réaffûter selon les spécifications correctes
	Avance ou vitesse de coupe trop élevées	Ajuster les conditions de coupe selon le catalogue
Trou sous dimensionné	Enlèvement de matière insuffisant	Accroître la surépaisseur de matière
	Trop de chaleur dégagée lors de l'alésage. Le trou s'élargit et se rétrécit	Accroître le flux d'huile
	Le diamètre de l'outil est détérioré et sous-dimensionné	Réaffûter selon les spécifications correctes
	Avance et vitesse de coupe trop faibles	Ajuster les conditions de coupe selon le catalogue
	Le trou de pré perçage est trop petit	Diminuer la surépaisseur de matière
Trous ovales et coniques	Jeu dans la broche de la machine	Réparer et rectifier l'axe
	Mauvais alignement entre l'outil et le trou	Utiliser un alésoir guide
	Angle de chanfrein d'entrée asymétrique	Réaffûter selon les spécifications correctes
Mauvaise finition de trou	Enlèvement de surépaisseur excessif	Diminuer la surépaisseur de matière
	Détérioration de l'outil	Réaffûter selon les spécifications correctes
	Angle de coupe trop faible	Réaffûter selon les spécifications correctes
	Huile de coupe ou émulsion trop diluée	Accroître le % de concentration
	Avance et/ou vitesse trop faibles	Ajuster les conditions de coupe selon le catalogue
	Vitesse de coupe trop élevée	Ajuster les conditions de coupe selon le catalogue
L'outil se bloque et casse	Détérioration de l'outil	Réaffûter selon les spécifications correctes
	La conicité arrière de l'outil est trop faible	Vérifier et remplacer / modifier l'outil
	Une dépouille trop grande	Vérifier et remplacer / modifier l'outil
	Le matériau de la pièce usinée a tendance à se resserrer	Utiliser un alésoir réglable pour compenser le jeu
	Le trou de pré perçage est trop petit	Diminuer la surépaisseur de matière
	Matériau hétérogène avec inclusions dures	Utiliser un alésoir en carbure monobloc

TARAUDAGE

RECOMMANDATIONS GENERALES POUR LE TARAUDAGE

Le succès de toute opération de taraudage est fonction d'un nombre de facteurs, chacun affectant la qualité du produit fini.

1. Sélectionner le type de taraud qui convient à la matière de la pièce et au type de trou, borgne ou débouchant, dans le tableau de classification des matériaux.
2. Veiller à la rigidité du bridage de la pièce, tout mouvement latéral pouvant causer la rupture du taraud ou la production d'un filetage de mauvaise qualité.
3. Sélectionner le diamètre de foret correct sur la page adéquate du catalogue. Veiller toujours à éviter autant que possible l'écrouissage de la pièce.
4. Sélectionner la vitesse de coupe correcte comme il est décrit sur la page produit du catalogue.
5. Utiliser le liquide de coupe adapté à l'application.
6. Sur les machines à commandes numériques, veiller à ce que le programme utilise une valeur de pas correcte. Avec un adaptateur de taraudage, utiliser 95 % à 97 % du pas pour permettre au taraud de générer son propre pas.
7. Si possible, utiliser un adaptateur de taraudage à limiteur de couple de bonne qualité, qui laisse le taraud libre de se déplacer dans le sens axial tout en garantissant sa perpendicularité par rapport au trou. Ces adaptateurs protègent également le taraud et évitent sa rupture s'il touche accidentellement le fond d'un trou borgne.
8. Veiller à la régularité de l'entrée du taraud dans le trou, car une avance irrégulière peut produire un évasement.

CORRESPONDANCE DES CLASSES DE TOLERANCE DU TARAUD ET DU FILETAGE INTERIEUR (ECROU)

Classe de tol. du taraud			Tolérance du filetage intérieur (Ecrou)					Application
ISO	DIN	ANSI BS						
ISO 1	4 H	3 B	4 H	5 H				Ajustement sans tolérance
ISO 2	6 H	2 B	4 G	5 G	6 H			Ajustement normal
ISO 3	6 G	1 B			6 G	7 H	8 H	Ajustement avec une large tolérance
-	7 G	-				7 G	8 G	Ajustement lâche pour être suivi d'un traitement du revêtement

INTERRUPTIONS DURANT LE TARAUDAGE

Problème	Cause	Remède
Surcoté	Tolérance incorrecte	Choisir un taraud avec une tolérance de filet plus faible
	Taux d'avance axiale incorrect	Réduire le taux d'avance de 5 à 10% ou augmenter la compression du mandrin de taraudage
	Taux d'avance axiale incorrect	Utiliser une coupe gun pour les trous débouchants ou une goujure hélicoïdale pour les trous borgnes. Utiliser un taraud revêtu pour éviter les arêtes rapportés. Consulter le catalogue ou le Product Selector pour un bon choix d'outil.
	Le taraud n'est pas centré sur le trou	Vérifier le mandrin de taraudage et la position du taraud dans le trou.
	Manque de lubrification	Utiliser la bonne lubrification pour éviter les arêtes rapportées. Voir la section sur les lubrifiants dans le guide technique.
	Vitesse de taraud trop lente	Suivre les recommandations dans le catalogue/Product Selector.
Souscôté	Mauvais choix de taraud pour l'application	Utiliser une coupe gun pour les trous débouchants ou une goujure hélicoïdale pour les trous borgnes. Utiliser un taraud revêtu pour éviter les arêtes rapportés. Consulter le catalogue ou le Product Selector pour un bon choix d'outil.
	Tolérance incorrecte	Choisir un taraud avec une tolérance plus élevée, surtout dans les matières avec de faibles tendances au surcotage, telles que la fonte, l'acier inoxydable.
	Mauvais lubrifiant ou manque de lubrifiant	Utiliser une bonne lubrification afin d'éviter le blocage des copeaux dans le trou. Voir la section sur les lubrifiants dans le guide technique.
	Trou de perçage avant taraudage trop petit	Augmenter le diamètre du foret au maximum. Vérifiez le diamètre de perçage.
	Rétrécissement de la matière après taraudage	Voir les recommandations dans la Catalogue/Product Selector pour un bon choix d'outil.
Copeaux	Mauvais choix de taraud pour l'application	Utiliser une coupe gun pour les trous débouchants ou une goujure hélicoïdale pour les trous borgnes. Utiliser un taraud revêtu pour éviter les arêtes rapportés. Consulter le catalogue ou le Product Selector pour un bon choix d'outil.
	Mauvais lubrifiant ou manque de lubrifiant	Utiliser une bonne lubrification afin d'éviter les arêtes rapportées. Voir la section sur les lubrifiants dans le guide technique.
	Les tarauds heurtent le fond du trou	Augmenter la profondeur du perçage ou diminuer la profondeur du taraudage.
	Travail de surfaces difficiles	Réduire la vitesse, utiliser un outil revêtu, utiliser une bonne lubrification. Voir la section sur l'usinage de l'acier inoxydable dans le guide technique.
	Blocage des copeaux à l'inversion	Eviter un retour soudain du taraud à l'inversion.
	Le chanfrein heurte l'entrée du trou	Vérifier la position axiale et réduire l'erreur axiale de la pointe du taraud sur le centre du trou.
	Le trou de pré taraudage est trop petit	Augmenter le diamètre de perçage à la valeur maximale. Vérifiez le diamètre de percage.

INTERRUPTIONS DURANT LE TARAUDAGE

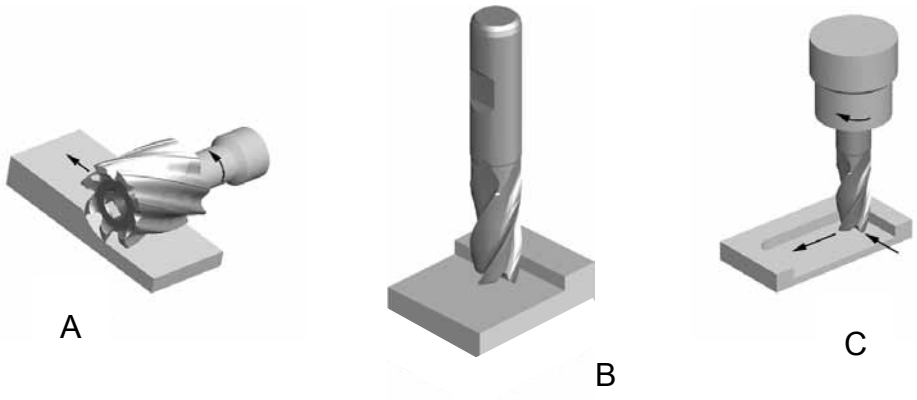
Problème	Cause	Remède
Casse	Le taraud s'use	Utiliser un nouveau taraud ou réaffûter l'ancien.
	Manque de lubrifiant	Utiliser une bonne lubrification pour éviter les arêtes rapportées et le bourrage des copeaux. Voir la section sur les lubrifiants dans le guide technique.
	Les tarauds heurtent le fond du trou	Augmenter la profondeur du perçage ou diminuer la profondeur du taraudage.
	La Vitesse du taraud trop élevée	Réduire la vitesse de coupe. Suivre les recommandations du Catalogue/Product Selector.
	Travail de surfaces difficiles	Réduire la vitesse, utiliser un outil revêtu, utiliser une bonne lubrification. Voir la section sur l'usinage de l'acier inoxydable dans le guide technique.
	Trou de perçage avant taraudage trop petit	Augmenter le diamètre du foret au maximum. Voir le tableau.
	Couple trop élevée	Utiliser un attachement de taraudage ajustable.
	Rétrécissement de la matière après taraudage	Voir les recommandations du Catalogue/Product Selector pour un choix correct d'outil.
Usure rapide	Mauvais type de taraud pour l'application	Utiliser un taraud avec un angle de coupe plus faible et/ou un relief plus fort et/ou un chanfrein plus long. Utiliser un outil revêtu. Consulter le Catalogue/Product Selector pour sélectionner l'outil correct.
	Manque de lubrifiant	Utiliser une bonne lubrification afin d'éviter les arêtes rapportées ou l'usure thermique sur les arêtes de coupe dans le guide technique. Voir la section sur les lubrifiants.
	Vitesse du taraud trop élevée	Réduire la vitesse de coupe, Suivre les recommandations du Catalogue/Product Selector.
Arêtes de coupe rapportées	Mauvais type de taraud pour l'application	Utiliser un taraud avec un angle de coupe plus faible et/ou un relief plus fort. Consulter le Catalogue/Product Selector.
	Manque de lubrifiant	Utiliser une bonne lubrification afin d'éviter les arêtes rapportées. Voir la section sur les lubrifiants.
	Traitement de surface non adéquat	Choisir un taraud avec le traitement approprié.
	Vitesse de taraudage trop lente	Suivre les recommandations du Catalogue/Product Selector.

Fraisage

RECOMMANDATIONS GENERALES POUR LE FRAISAGE

Le fraisage est un procédé qui réalise un état de surface par enlèvement progressif d'une certaine quantité de matière de la pièce usinée à un taux de mouvement ou d'avance relativement faible par une fraise tournant à une vitesse comparativement élevée.
La caractéristique principale du procédé de fraisage est l'enlèvement de matière sous forme de copeaux individuels par chaque dent.

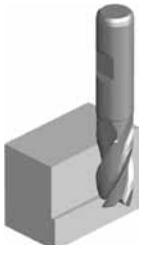
TYPES DE FRAISES
Les trois opérations de fraisage de base sont décritent ci-dessous : (A) fraisage périphérique, (B) fraisage en bout ou de surface, (C) fraisage de finition.



Lors du fraisage périphérique (également appelé dressage), l'axe de rotation de la fraise est parallèle à la surface de la pièce à usiner. La fraise a un certain nombre de dents autour de sa circonférence, chaque dent agissant en un seul point comme les outils coupants appelés fraises une taille.
Les fraises utilisées en fraisage périphérique peuvent avoir une denture droite ou hélicoïdale réalisant une action de coupe orthogonale ou oblique.
Lors du fraisage en bout, la fraise est montée sur une broche avec un axe de rotation perpendiculaire à la surface de la pièce usinée. La surface fraisée résulte d'une action des arêtes de coupe situées sur la périphérie ou le bout de la fraise.
Lors du fraisage de finition, la fraise tourne généralement sur un axe vertical de la pièce usinée. Les dents de coupe se situent à la fois sur le bout de la fraise et sur la périphérie du corps de la fraise.

APPLICATIONS

Le TEM et les applications sont extrêmement liés. Pour chaque type d'application il peut y avoir différents TEM qui augmentent selon l'engagement de la fraise dans la pièce usinée. Le Catalogue Dormer contient des icônes décrivant les différentes applications.

Contournage	Fraisage en bout	Rainurage	Fraisage en plongée	Ramping
				


La profondeur radiale de la coupe doit être inférieure à 0,25 du diamètre de la fraise.	La profondeur radiale de coupe ne doit pas dépasser 0,9 du diamètre, la profondeur axiale inférieure à 0,1 du diamètre.	Usinage d'une rainure de clavette. La profondeur radiale est égale au diamètre de la fraise.	Il est possible de percer la pièce usinée avec une fraise de finition en se servant simplement de la coupe au centre. Dans cette opération l'avance doit être divisée par deux.	Entrée à la fois axiale et radiale dans la pièce usinée.

PROBLÈMES LORS DU FRAISAGE

Problème	Cause	Remède
Casse	Enlèvement de copeaux trop important	Diminuer l'avance par dent
	Avance trop rapide	Diminuer l'avance
Usure	Longueur taillée ou totale trop importante	Utiliser une fraise plus courte
	Matière de la pièce usinée trop dure	Consulter le Catalogue ou le Selector pour trouver l'outil qui correspond à la matière ou avec le revêtement adéquat
	Mauvaises avance et vitesse	Consulter le Catalogue ou Selector pour trouver les paramètres corrects
	Faible évacuation des copeaux	Repositionner le lubrifiant
	Fraisage en opposition	Fraisage en avalant
	Mauvaise hélice de fraise	Consulter le Catalogue ou Selector pour trouver l'alternative correcte
Copeaux	Taux d'avance trop élevé	Réduire le taux d'avance
	Vibrations	Réduire le RPM
	Faible vitesse de coupe	Augmenter le RPM
	Fraisage en opposition	Fraisage en avalant
	Rigidité de l'outil	Choisir un outil plus court ou engager plus la queue dans le mandrin
	Rigidité de la pièce usinée	Maintenir la pièce fortement
Durée de vie courte	Matière travaillée résistante	Consulter le Catalogue ou Selector pour trouver l'alternative correcte
	Mauvais angle de coupe	Modifier l'angle de coupe
	Friction de la fraise/pièce usinée	Utiliser un outil revêtu
Mauvaise finition de surface	Avance trop élevée	Diminuer jusqu'à la vitesse correcte
	Vitesse trop faible	Augmenter la vitesse
	Petits copeaux	Diminuer l'enlèvement de copeaux
	Usure d'outil	Remplacer ou réaffûter l'outil
	Arête de coupe rapportée	Modifier l'hélice de l'outil
	Copeaux collants	Augmenter la quantité d'huile

Problème	Cause	Remède
Manque de précision de la pièce usinée	Déflexion de l'outil	Choisir un outil plus court ou engager davantage la queue dans le mandrin
	Nombre de dents insuffisant	Utiliser un outil avec plus de dents
	Usure du mandrin	Le réparer ou le remplacer
	Faible rigidité du mandrin	Utiliser un mandrin plus petit et/ou plus rigide
	Faible rigidité de la broche	Utiliser une broche plus large
Vibration	Avance et vitesse trop élevées	Corriger la vitesse et l'avance à l'aide du Catalogue ou Sélector
	Longueur taillée et totale trop importante	Enfoncer la queue dans le mandrin et utiliser une fraise plus courte
	Coupe trop profonde	Diminuer la profondeur de coupe
	Pas assez de rigidité	Vérifier le mandrin et le changer si nécessaire

SIMPLY RELIABLE

As a professional you can judge the quality of work by just looking at the chip. Our chip is a clean and uncomplicated shape that in itself tells a story. It is a clear and consistent signal and that's why we use it as a symbol for being simply reliable.
